introduction

Pornography has always been a controversial topic, precisely among adolescents. According to Ong Chin Lan, the Assistant Commissioner, Malaysia is the country with the biggest number of IP addresses for downloading and uploading pornography in Southeast Asia. With the current technology, pornography becomes easily accessible to everyone regardless of age.

risk of bad health

- Adolescent's self-esteem could deteriorate as they compare themselves with porn stars, which could lead to severe depression.
- Pornography consumption can affect the volume of grey matter in the brain, which can lead to neurological illnesses.
- Unethical sexual activities like anal sex can increase the risks of STDs diseases.

conclusion

Pornography is very easy to be spread worldwide. Education institutions and parents must play an important role to educate and monitor what adolescents search in order to correct their mannerisms and understanding. This could help prevent more negative side effects from occurring. Everyone must play a significant role to overcome pornography addiction.
