

The thing I learned in this project is that, I understand more about hypothesis testing, correlation, anova, regression and goodness of fit test. I refer to the slide in the e-learning and also went through slowly by narrated slides that is given by our lecturer. Every test need to be understand deeply and I learned how to differentiate and use the test according to the data given. I am able to detect which test statistic I am going to use for the test depends on the number of sample or the variables given. I watched some videos in YouTube to get better understanding about this R coding. All of this resources help me so well to do this report and coding in RStudio. what I have learned in e-learning and also refer to my notes if I don't understand. This was my favourite course.
