

In this page I will tell the story and the summarization about my journey in order to finish the 10 module of AWS and get the badge and certificate. Before that I will give a simple definition about AWS. In general Amazon Web Services or AWS is an actual name for cloud computing and it is another computer utilities. It function as an online platform that offers a scalable and cost-effective cloud computing solutions. I start the AWS module in late December 2021 and finish it in the middle of January 2022. It took me almost a month to finish it since I have a lot of assignment to do and I do not have time to complete it. But glad that I still manage to finish it before the due date that given by my lecturer. By completing the AWS course, I gain new knowledge about cloud computing and it help me by increase my understanding about cloud computing since I do not have any basic about cloud computing before so this course really help me to understand it. To be honest I do feel give up while finish this course since I think 10 module was overload that time but since I have a dream to graduate from university with flying colours result and I realised that this AWS course give me marks for my assessment, so by hook or by crook I need to complete it. That was my motivation to complete this project. In my opinion getting the badge is easy because you just need to finish all 10 module and if you cannot achieve the requirement you still have chances to repeat it until you achieve the requirement. For the lab, it provide you with instruction so it easy for student to do it and you just need to follow it one by one and no rush. The easiest module for sure module 1 since it just the introduction to the course and for the most difficult I'm not sure. For me the badge was worth it since we can use it for our resume soon. As I said before, this course really help me in understanding about cloud computing so by getting the badge it showed that I can improve my skills in cloud computing. Since we already live in 21st century so I think every company should shift to cloud computing for better operation of the company. But as a manager or someone that responsibility in this shift process they need to have back up plans since everything in world have pros and cons. To avoid something bad happen, it is good to have back up plan. As a new student of computer science course I think it is good if all computer science student learn about this because it will help you in future and the badge you can use for future. My advice to all of my friends that did not get this badge yet, just finish it until you get it. You will feel regret if you did not get it. That is all for my journey story and a little summarization about AWS course.
