Materials & Specifications

# Soil

## as an Engineering Material

---

---

---

---

---

---

---

---

UTM  
UNIVERSITI TEKNOLOGI MALAYSIA  
www.utm.my

To a civil engineer a SOIL is :-

- an accumulation of mineral or rock particles
- un-cemented or weakly cemented
- unconsolidated or poorly consolidated has voids filled with air or water formed by natural weathering processes
- can be in-situ or reworked by transport and deposition
- can be sorted or unsorted

---

---

---

---

---

---

---

---

UTM  
UNIVERSITI TEKNOLOGI MALAYSIA  
www.utm.my

To a civil engineer a SOIL is :-

### Why do we care about soil?

- Soil resources were and are a central factor in shaping human history and development.
- Survival of humans and animals is dependent on light, water, air and soil.
- Good, productive soil is a basic human need.
  - Grow our food, clean our water, clean our air

---

---

---

---

---

---

---

---

[www.utm.my](http://www.utm.my)

### What does soil DO?'

1. Soil serves as a natural medium for the growth of plants,
2. regulates and purifies water,
3. recycles organic wastes and nutrients,
4. provides habitat for soil organisms, and
5. serves as physical support for building and construction.

**= Soil functions**

---

---

---

---

---

---

---

---

[www.utm.my](http://www.utm.my)

### What is Soils?

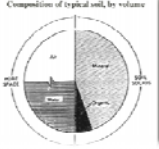

The unconsolidated mineral and organic material on the immediate surface of the earth that serves as a natural medium for plant growth

**Soil = solids + pore space**

\*Solids = Mineral + Organic matter

\*Pore space = Air + Water

Composition of typical soil, by volume

---

---

---

---

---

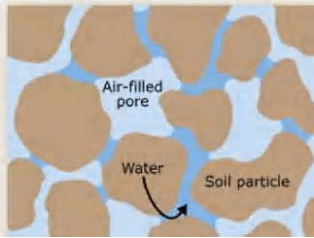

---

---

---

[www.utm.my](http://www.utm.my)

---

---

---

---

---

---

---

---

www.utm.my

“Soil is a mixture of weathered rock, decayed organic matter, mineral fragments, water and air”

---

---

---

---

---

---

---

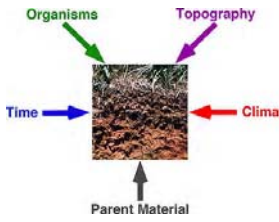

---

www.utm.my

### Soils forming factors

Where did Soil came from?

Soil has been formed by 5 major factors:

1. Parent material (original form)
2. Climate (precipitation and temperature effects)
3. Macro- and microorganisms
4. Topography (elevation, slope, position)
5. Time

---

---

---

---

---

---

---

---

www.utm.my

### Soil layers

---

---

---

---

---

---

---

---

UTM  
UNIVERSITI TEKNOLOGI MALAYSIA

www.utm.my

## Soil texture

Soil texture is the percentage of sand, silt and clay in a given soil

- Sand            0.05 mm to 2 mm
- Silt             0.002 mm to 0.05 mm
- Clay            <0.002 mm

Clays can hold water & have high water content compared to sand and silt

---

---

---

---

---

---

---

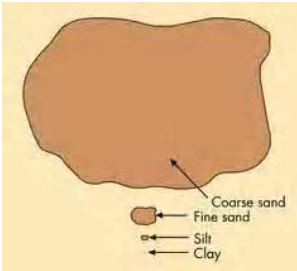

---

UTM  
UNIVERSITI TEKNOLOGI MALAYSIA

www.utm.my

## Soil texture

---

---

---

---

---

---

---

---

UTM  
UNIVERSITI TEKNOLOGI MALAYSIA

www.utm.my

## Soil texture

### Why is soil texture is important?

- The texture of soil affects many processes that occur within the soil e.g. **Infiltration** rates and **water holding capacity** (WHC)

\*WHC = how well the soil stores the water  
 \*Infiltration = how fast the water enters the soil surfaces

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**UTM**  
UNIVERSITI TEKNOLOGI MALAYSIA  
www.utm.my

## Types of soil structure

**2 broad groups – plus any mixture between**

<b>granular</b>	clay rich
coarse	fine
cobbles, gravel, sand, silt	<b>clays</b>
rocks & quartz	clay minerals
non cohesive	cohesive

air and water can be present

**WATER** is key factor in soil behaviour

---

---

---

---

---

---

---

---

**UTM**  
UNIVERSITI TEKNOLOGI MALAYSIA  
www.utm.my

## Granular soils

- no cohesion (unless clay present)
- shear strength depends on internal friction  $\phi$  ( $30^\circ$  to  $45^\circ$ ) (grain shape, angularity, size, grading, packing density)
- settlement usually small
- $\phi$  gives natural slope angle

---

---

---

---

---

---

---

---

 **UTM**  
UNIVERSITI TEKNOLOGI MALAYSIA  
www.utm.my

## Clay soils

The most "interesting" and challenging for civil engineers  
clay minerals are microscopic ( $<0.002\text{mm}$ ) sheet like minerals  
complex silicates formed from breakdown of feldspars and  
other minerals

silica (silicon & oxygen)  
alumina (aluminium, oxygen & hydrogen)

these units are combined in layers

---

---

---

---

---

---

---

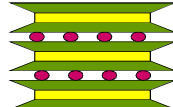

---

 **UTM**  
UNIVERSITI TEKNOLOGI MALAYSIA  
www.utm.my

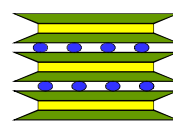

## How the units are combined gives rise to different clay minerals

*Kaolinite* has hydrogen between each pair of units

*Illite* includes iron & magnesium in basic structure with potassium in between

*Montmorillonite* has same units as illite but water is between units this is a very weak bond

---

---

---

---

---

---

---

---

 **UTM**  
UNIVERSITI TEKNOLOGI MALAYSIA  
www.utm.my

Clays can hold water & have high water content  
Amount of water allows solid, plastic or liquid states  
Plastic Limit & Liquid Limit can be defined & used  
clay soils are **COHESIVE (consistent)**, due to interparticle bonds  
both shear strength and cohesion are a function of water content  
when water content is high clays become liquid with zero cohesion & shear strength  
Drainage rates from clays are very low – give a major problem

---

---

---

---

---

---

---

---

### Differential Settlement is a Particular Problem

---

---

---

---

---

---

---

---

### Clay Shrinkage is also a problem

tree removal can also be problematic

---

---

---

---

---

---

---

---

### Stormwater Management and Road Tunnel (SMART) Project

---

---

---

---

---

---

---

---

What is the unique feature of this project ?

The 3-km double-deck motorway within the storm water tunnel.

### Method of Construction

A large section of KL City sits on karstic limestone

Kuala Lumpur city sits on karstic limestone geology with high ground water table - karstic limestone include cliffs, pinnacles, cavities, collapsed cavities and sinkhole.

Due to the nature of the soil condition, a construction method that would have minimal negative impact on the geological condition of the soil is selected.

After much research, study and survey, the Slurry Shield TBM was chosen. This machine is designed to overcome problems of groundwater drawdown.

### Stormwater Management and Road Tunnel (SMART) Project

- Slurry Shield TBM (Tuah and Gemilang) was chosen as the construction method on Karstic limestone geology condition in Kuala Lumpur.
- The total cost of the project is around RM 2 billion.
- The project started on 1st January 2003 completed in December 2006

TBM TUNNEL – SOUTH DRIVE

Tunnel Boring Machine broke through at South Junction Box on 04/06/05

---

---

---

---

---

---

---

---

## Soil Erosion

The loss of soil from the landscape

Caused by:

- Water movement
- Wind
- Man /mechanical (e.g. construction sites)

---

---

---

---

---

---

---

---

Niigata Earthquake, 1964, Japan

---

---

---

---

---

---

---

---

Sand Boils, Niigata, 1964

**saturated loose sand**

loosely consolidated sand  
vibration produced compaction  
pore pressure increased  
water forced out  
erupted at surface, "sand boils"  
effective stress near zero  
sand liquefied  
buildings foundered

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**Slope Failure in Clay Soils**

Landslide - slow  
Flowslide - fast

Mam Tor, England

*Shivering Mountain* famous for its instability of its lower shale layers

### A History of Tip Failures

- 1939 Cilfinnydd – 180,000 tonnes (*few miles to South*)
- 1944 Aberfan No 4 Tip
- 1956 Aberfan No 5 Tip
- 1963 Aberfan No 7 Tip

### Heavy rainfall in period before slide

- Tip saturated
- Water table high
- Springs flowing at great rate

---

---

---

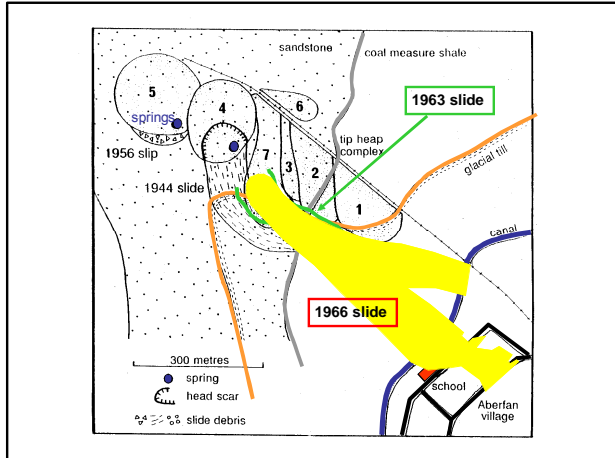

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Investigated by Tribunal which sat for 76 days

#### Quote

...the Aberfan Disaster is a terrifying tale of bungling ineptitude by many men charged with tasks for which they were totally unfitted, of failure to heed clear warnings and of total lack of direction from above.

Not villains but decent men, led astray by foolishness or by ignorance or by both in combination, are responsible for what happened at Aberfan.

Blame rested with the National Coal Board  
No controls on tipping  
Warning signs ignored  
Knowledge was available but those responsible were ignorant

---

---

---

---

---

---

---

---

---

---

---

---

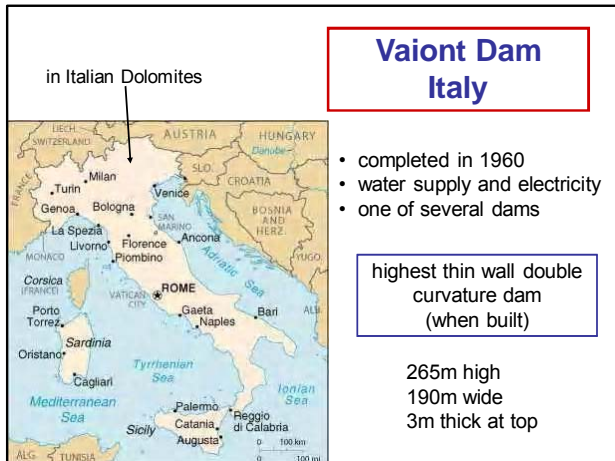

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

On evening of 9 October 1963

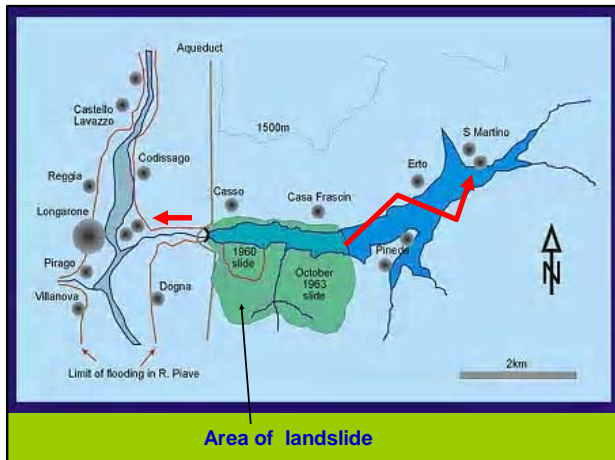

### World's worst dam disaster

Longarone and several other villages were flooded when a massive landslide went into reservoir.

A wall of water went upstream and downstream

**2600 people died**

Landslide 1.8km X 1.6km - approx 240,000,000 m<sup>3</sup>  
Water reached 260m above reservoir level and overtopped dam by 100m – dam survived

Looking for survivors

---

---

---

---

---

---

---

---

Dam

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Background to Disaster

- rocks – limestones with shale / clay layers
- structure – syncline fold - axis parallel to valley
- stress – due to folding and rapid erosion
- instability – old landslides on north side

---

---

---

---

---

---

---

---

### Background to Disaster

- Chief Engineer unhappy about location during construction
- During initial filling smaller landslip movement on south side
- Water level was reduced and movement stopped
- Decided to try and control movement by varying water levels
  - seemed to work and so continued filling
  - several studies done by Electricity Industry consultants
- Constructed bypass tunnel on north side
- Filling restarted, but by Nov 1962 up to 12mm/day movement so water level lowered. Movement stopped by April 1963 so filled again.
- September 1963 moving again at up to 200mm/day so tried to empty
- Heavy rainfall end of Sept and early Oct
- All animals left the area by early October

---

---

---

---

---

---

---

---

1960 landslide

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Causes

- deep seated landslide on clay layers between limestone, plus probably new slide
- water from rain and reservoir had reduced effective stress in bedding planes
- rapid drawdown had probably made things worse by inducing additional hydraulic pressures and by removing support

---

---

---

---

---

---

---

---

## Lessons

- wrong location, no attention to geology
- total underestimation of effects and scale of influence of groundwater (only considered initial landslide)
- ignorance of soil / rock mechanics
- dismissal of unpopular information or opinions
- vested interests outweighed public safety
- poor communications in controlling organisation (up and down)
- lack of responsibility

*dam design was superb but in the wrong place*

---

---

---

---

---

---

---

---

no water – no sandcastles  
1 part water, 8 parts sand  
suction produced

---

---

---

---

---

---

---

---

## Soils and Clays a Major Challenge for Civil Engineers

need to fully understand  
to ensure YOU get it right

Any Questions?

---

---

---

---

---

---

---

---
