Universiti Teknologi Melayu

Modular Programming

- **Modular programming:** breaking a program up into smaller, manageable functions or modules
- **Function:** a collection of statements to perform a task
- Motivation for modular programming:
 - Improves maintainability of programs
 - Simplifies the process of writing programs

innovative • entrepreneurial • global www.utm.my

UTM
Universiti Teknologi Melayu

This program has one long, complex function containing all of the statements necessary to solve a problem.

```
int main()
{
    statement;
    statement;
}
```

In this program the problem has been divided into smaller problems, each of which is handled by a separate function.

```
int main()
{
    statement;
    statement;
    statement;
}

void function2()
{
    statement;
    statement;
    statement;
}

void function3()
{
    statement;
    statement;
    statement;
}

void function4()
{
    statement;
    statement;
    statement;
}
```

main function
function 2
function 3
function 4

UTM
Universiti Teknologi Melayu

Function

- A **collection of statements** that performs a specific task.
- Commonly used to **break a problem** down into small manageable pieces.
- In C++, there are 2 types of function:
 - Library functions
 - User-defined functions

innovative • entrepreneurial • global www.utm.my

UTM
Universiti Teknologi Melayu

Library Functions

- "Built-in" functions that **come with the compiler**.
- The source code (definition) for library functions does NOT appear in your program.
- To use a library function, you simply need to **include the proper header file** and know the name of the function that you wish to use.
 - `#include compiler directive`

innovative • entrepreneurial • global www.utm.my

UTM
Universiti Teknologi Melayu

Library Functions (cont.)

- Libraries under discussion at this time:

Compiler directive	Purpose
<code><ctype></code>	Character classification and conversion
<code><cmath></code>	Math functions
<code><stdlib></code>	Data conversion
<code><time></code>	Time functions

innovative • entrepreneurial • global www.utm.my

Library Functions (cont.)

- A collection of specialized functions.
- C++ promotes code reuse with predefined classes and functions in the standard library
- The functions work as a black box:

Math Functions

- Required header: #include <cmath>
- Example functions

Function	Purpose
abs(x)	returns the absolute value of an integer.
pow(x,y)	calculates x to the power of y . If x is negative, y must be an integer. If x is zero, y must be a positive integer.
pow10(x)	calculates 10 to the power of x .
sqrt(x)	calculates the positive square root of x . ($x \geq 0$)

Library Functions: Example 1

```

#include <iostream>
#include <cmath>
using namespace std;
int main()
{
    double area, radius;

    cout<< "This program calculates the area of a
circle.\n";
    cout<<"What is the radius of the circle? ";
    cin>>radius;
    area=3.14159 * pow(radius,2.0);
    cout<<"The area is " << area << endl;
    system ("pause");
    return 0;
}
  
```

Library Functions: Example 2

```

#include <iostream>
#include <cmath>
using namespace std;
main()
{
    int nom1,nom2, result;
    cout<<"Enter two numbers";
    cin>>nom1>>nom2;
    if ((nom1<0)||(nom2<0))
    {
        cout<<"negative number/s";
    }
    else
    {
        result= sqrt(nom1 + nom2);
        cout<<"The square root of "<< nom1+nom2 << "is"
        << result;
    }
}
  
```

More Mathematical Functions

Function	Standard Library	Purpose: Example	Argument(s)	Result
abs(x)	<cstdlib>	Returns the absolute value of its integer argument: if $x = -5$, $abs(x)$ is 5	int	int
ceil(x)	<cmath>	Returns the smallest integral value that is not less than x : if $x = 45.23$, $ceil(x)$ is 46.0	double	double
cos(x)	<cmath>	Returns the cosine of angle x : if $x = 0.0$, $cos(x)$ is 1.0	double (radians)	double
exp(x)	<cmath>	Returns e^x where $e = 2.71828...$: if $x = 1.0$, $exp(x)$ is 2.71828	double	double
fabs(x)	<cmath>	Returns the absolute value of its type double argument: if $x = -8.432$, $fabs(x)$ is 8.432	double	double
floor(x)	<cmath>	Returns the largest integral value that is not greater than x : if $x = 45.23$, $floor(x)$ is 45.0	double	double

More Mathematical Functions

log(x)	<cmath>	Returns the natural logarithm of x for $x > 0.0$: if x is 2.71828, $log(x)$ is 1.0	double	double
log10(x)	<cmath>	Returns the base-10 logarithm of x for $x > 0.0$: if x is 100.0, $log10(x)$ is 2.0	double	double
pow(x, y)	<cmath>	Returns x^y . If x is negative, y must be integral: if x is 0.16 and y is 0.5, $pow(x, y)$ is 0.4	double,	double
sin(x)	<cmath>	Returns the sine of angle x : if x is 1.5708, $sin(x)$ is 1.0	double (radians)	double
sqrt(x)	<cmath>	Returns the non-negative square root of x for $x \geq 0.0$: if x is 2.25, $sqrt(x)$ is 1.5	double	double
tan(x)	<cmath>	Returns the tangent of angle x : if x is 0.0, $tan(x)$ is 0.0	double (radians)	double

More Mathematical Functions

- Require `cmath` header file
- Take `double` as input, return a `double`
- Commonly used functions:

<code>sin</code>	Sine
<code>cos</code>	Cosine
<code>tan</code>	Tangent
<code>sqrt</code>	Square root
<code>log</code>	Natural (e) log
<code>abs</code>	Absolute value (takes and returns an int)

innovative • entrepreneurial • global

www.utm.my

More Mathematical Functions

- These require `cstdlib` header file
- `rand()`: returns a random number (`int`) between 0 and the largest `int` the computer holds. Yields same sequence of numbers each time program is run.
- `srand(x)`: initializes random number generator with unsigned `int` `x`

innovative • entrepreneurial • global

www.utm.my

In-Class Exercise

- Do Lab 10, Exercise 2, No. 1 (pg. 141)
- Do Lab 10, Exercise 2, No. 2 (pg. 141)

innovative • entrepreneurial • global

www.utm.my

General Purpose Library

- These require `cstdlib` header file
- `rand()`: returns a random number (`int`) between 0 and the largest `int` the computer holds. Yields same sequence of numbers each time program is run.
- `srand(x)`: initializes random number generator with unsigned `int` `x`

innovative • entrepreneurial • global

www.utm.my

Character Manipulation

- The C++ library provides several functions for testing characters.
- To use these functions, you must include the `cctype` header file.

FUNCTION	MEANING
<code>isalpha</code>	true if arg. is a letter, false otherwise
<code>isalnum</code>	true if arg. is a letter or digit, false otherwise
<code>isdigit</code>	true if arg. is a digit 0-9, false otherwise
<code>islower</code>	true if arg. is lowercase letter, false otherwise
<code>isprint</code>	true if arg. is a printable character, false otherwise
<code>ispunct</code>	true if arg. is a punctuation character, false otherwise
<code>isupper</code>	true if arg. is an uppercase letter, false otherwise
<code>isspace</code>	true if arg. is a whitespace character, false otherwise

innovative • entrepreneurial • global

www.utm.my

Example – Character Testing

```
#include <iostream>
#include <cctype>
using namespace std;
int main()
{
    char input;
    cout<<"Enter any character: ";
    cin.get(input);
    if (isalpha(input))
        cout.put(input);
    cout<<"It is an alphabet";
    if (isdigit(input))
        cout<<"It is a digit";
    if (islower(input))
        cout<<"The letter entered is lowercase";
    if (isupper(input))
        cout<<"The letter entered is uppercase";
    return 0;
}
```

innovative • entrepreneurial • global

www.utm.my

Exercise 01

- Write a program with if statements that will display the word "digit" if the variable `ch` contains numeric data, or display the word "letter" if the variable `ch` contains alphabet data. Otherwise, it should display "special character"

innovative • entrepreneurial • global

www.utm.my

Character Case Conversion

- Require `cctype` header file
- Functions:

toupper: if `char` argument is lowercase letter, return uppercase equivalent; otherwise, return input unchanged

```
char ch1 = 'H';
char ch2 = 'e';
char ch3 = '!';
cout << toupper(ch1); // displays 'H'
cout << toupper(ch2); // displays 'E'
cout << toupper(ch3); // displays '!'
```

innovative • entrepreneurial • global

www.utm.my

Character Case Conversion

- Functions:

tolower: if `char` argument is uppercase letter, return lowercase equivalent; otherwise, return input unchanged

```
char ch1 = 'H';
char ch2 = 'e';
char ch3 = '!';
cout << tolower(ch1); // displays 'h'
cout << tolower(ch2); // displays 'e'
cout << tolower(ch3); // displays '!'
```

innovative • entrepreneurial • global

www.utm.my

Example – Character Case Conversion

```
#include <iostream>
#include <cctype>
using namespace std;

int main()
{
    char input[15];
    cout << "Enter a name ";
    cin >> input;
    for(int i=0;input[i] != '\0';i++)
        input[i]=toupper(input[i]);
    cout << "The name in upper case is:" << input;
    return 0;
}
```

innovative • entrepreneurial • global

www.utm.my

Character Manipulating Functions

Display 9.3 Some Functions in <cctype> (part 1 of 2)

FUNCTION	DESCRIPTION	EXAMPLE
<code>toupper(Char_Exp)</code>	Returns the uppercase version of <code>Char_Exp</code> (as a value of type int).	<code>char c = toupper('a');</code> <code>cout << c;</code> <code>Outputs: A</code>
<code>tolower(Char_Exp)</code>	Returns the lowercase version of <code>Char_Exp</code> (as a value of type int).	<code>char c = tolower('A');</code> <code>cout << c;</code> <code>Outputs: a</code>
<code>isupper(Char_Exp)</code>	Returns true provided <code>Char_Exp</code> is an uppercase letter; otherwise, returns false.	<code>if (isupper(c))</code> <code>cout << "Is uppercase.;"</code> <code>else</code> <code>cout << "Is not uppercase.;"</code>
<code>islower(Char_Exp)</code>	Returns true provided <code>Char_Exp</code> is a lowercase letter; otherwise, returns false.	<code>char c = 'a';</code> <code>if (islower(c))</code> <code>cout << c << " is lowercase.;"</code> <code>Outputs: a is lowercase.</code>
<code>isalpha(Char_Exp)</code>	Returns true provided <code>Char_Exp</code> is a letter of the alphabet; otherwise, returns false.	<code>char c = '\$';</code> <code>if (isalpha(c))</code> <code>cout << "Is a letter.;"</code> <code>else</code> <code>cout << "Is not a letter.;"</code> <code>Outputs: Is not a letter.</code>

innovative • entrepreneurial • global

www.utm.my

Display 9.3 Some Functions in <cctype> (part 2 of 2)

FUNCTION	DESCRIPTION	EXAMPLE
<code>isdigit(Char_Exp)</code>	Returns true provided <code>Char_Exp</code> is one of the digits '0' through '9'; otherwise, returns false.	<code>if (isdigit(c))</code> <code>cout << "It's a digit.;"</code> <code>else</code> <code>cout << "It's not a digit.;"</code> <code>Outputs: It's a digit.</code>
<code>isalnum(Char_Exp)</code>	Returns true provided <code>Char_Exp</code> is either a letter or a digit; otherwise, returns false.	<code>if (isalnum('3'))</code> <code>cout << "Both alphanumeric.;"</code> <code>else</code> <code>cout << "One or more are not.;"</code> <code>Outputs: Both alphanumeric.</code>
<code>isspace(Char_Exp)</code>	Returns true provided <code>Char_Exp</code> is a whitespace character, such as the blank or newline character; otherwise, returns false.	<code>//skips over one "word" and sets c //equal to the first whitespace //character after the "word":</code> <code>do</code> <code>{</code> <code> cin.get(c);</code> <code>} while (!isspace(c));</code>
<code>ispunct(Char_Exp)</code>	Returns true provided <code>Char_Exp</code> is a punctuation character other than whitespace, a digit, or a letter; otherwise, returns false.	<code>if (ispunct('?'))</code> <code>cout << "Is punctuation.;"</code> <code>else</code> <code>cout << "Not punctuation.;"</code>
<code>isprint(Char_Exp)</code>	Returns true provided <code>Char_Exp</code> is a printing character; otherwise, returns false.	<code>Returns true provided</code> <code><code>Char_Exp</code> is a printing character other than whitespace; otherwise, returns false.</code>
<code>isgraph(Char_Exp)</code>	Returns true provided <code>Char_Exp</code> is a printing character other than whitespace; otherwise, returns false.	<code>Returns true provided</code> <code><code>Char_Exp</code> is a printing character other than whitespace; otherwise, returns false.</code>
<code>isctrl(Char_Exp)</code>	Returns true provided <code>Char_Exp</code> is a control character; otherwise, returns false.	<code>Returns true provided</code> <code><code>Char_Exp</code> is a control character; otherwise, returns false.</code>

 **Exercise 02**

- Write a program to toggle the contents of a string character from lower to upper case or vice versa.

innovative • entrepreneurial • global www.utrm.my

 **Review of the Internal Storage of C-Strings**

- C-string:** sequence of characters stored in adjacent memory locations and terminated by NULL character
- String literal (string constant):** sequence of characters enclosed in double quotes "":
"Hi there!"

H	i		t	h	e	r		e	!	\0
---	---	--	---	---	---	---	--	---	---	----

innovative • entrepreneurial • global www.utrm.my

 **Review of the Internal Storage of C-Strings**

- Array of chars can be used to define storage for string:

```
const int SIZE = 20;
char city[SIZE];
```
- Leave room for NULL at end
- Can enter a value using cin or >>
 - Input is whitespace-terminated
 - No check to see if enough space
- For input containing whitespace, and to control amount of input, use cin.getline()

innovative • entrepreneurial • global www.utrm.my

 **C-Strings Manipulation Functions**

- The C++ library has numerous functions for handling C-strings.
- Requires cstring header file be included.
- Functions take one or more C-strings as arguments. Can use:
 - C-string name
 - pointer to C-string
 - literal string

innovative • entrepreneurial • global www.utrm.my

 **Functions for C-Strings**

- Functions:
 - `strlen(str)`: returns length of C-string str

```
char city[SIZE] = "Missoula";
cout << strlen(city); // prints 8
```
 - `strcat(str1, str2)`: appends str2 to the end of str1

```
char location[SIZE] = "Missoula, ";
char state[3] = "MT";
strcat(location, state);
// location now has "Missoula, MT"
```

innovative • entrepreneurial • global www.utrm.my

 **Function for C-Strings**

- Functions:
 - `strcpy(str1, str2)`: copies str2 to str1

```
const int SIZE = 20;
char fname[SIZE] = "Maureen",
name[SIZE];
strcpy(name, fname);
```

Note: `strcat` and `strcpy` perform no bounds checking to determine if there is enough space in receiving character array to hold the string it is being assigned.

innovative • entrepreneurial • global www.utrm.my

Function for C-Strings

- Functions:

```
#include <iostream>
#include <cstring>
using namespace std;
int main()
{ char reply;
  char garment[]="overcoat";
  cout<<"Is it raining outside? Answer y/n\n";
  cin>>reply;
  if(reply=='y')
    strcpy(garment,"raincoat");
  cout<<"before you go out today take your "<<garment;
  return 0;
}
```

innovative • entrepreneurial • global

www.utm.my

Comparing C-Strings

- Also cannot use operator ==

```
char aString[10] = "Hello";
char anotherString[10] = "Goodbye";
aString == anotherString; // NOT allowed!
```
- Must use library function again:

```
if (strcmp(aString, anotherString))
  cout << "Strings NOT same.";
else
  cout << "Strings are same.";
```

innovative • entrepreneurial • global

www.utm.my

Working with C-Strings - Example

```
#include <iostream>
#include <cstring>
using namespace std;
int main()
{ char reply;
  char garment[]="overcoat";
  cout<<"Is it raining outside? Answer y/n\n";
  cin>>reply;
  if(reply=='y')
    strcpy(garment,"raincoat");
  cout<<"before you go out today take your "<<garment;
  return 0;
}
```

innovative • entrepreneurial • global

www.utm.my

Predefined C-String Functions

Display 9.1 Some Predefined C-String Functions in <cstring> (part 1 of 2)

FUNCTION	DESCRIPTION	CAUTIONS
strcpy(Target_String_Var, Src_String)	Copies the C-string value Src_String into the C-string variable Target_String_Var.	Does not check to make sure Target_String_Var is large enough to hold the value Src_String.
strcpy(Target_String_Var, Src_String, Limit)	The same as the two-argument strcpy except that at most Limit characters are copied.	If Limit is chosen carefully, this is safer than the two-argument version of strcpy. Not imple- mented in all versions of C++.
strcat(Target_String_Var, Src_String)	Concatenates the C-string value Src_String onto the end of the C-string in the C-string variable Target_String_Var.	Does not check to see that Target_String_Var is large enough to hold the result of the concatenation.
strcat(Target_String_Var, Src_String, Limit)	The same as the two argument strcat except that at most Limit characters are appended.	If Limit is chosen carefully, this is safer than the two-argument version of strcat. Not imple- mented in all versions of C++.

innovative • entrepreneurial • global

www.utm.my

Predefined C-String Functions

Display 9.1 Some Predefined C-String Functions in <cstring> (part 2 of 2)

FUNCTION	DESCRIPTION	CAUTIONS
strlen(Src_String)	Returns an integer equal to the length of Src_String. (The null character, '\0', is not counted in the length.)	
strcmp(String_1, String_2)	Returns 0 if String_1 and String_2 are the same. Returns a value < 0 if String_1 is less than String_2. Returns a value > 0 if String_1 is greater than String_2 (that is, returns a nonzero value if String_1 and String_2 are different). The order is lexicographic.	If String_1 equals String_2, this function returns 0, which converts to false. Note that this is the reverse of what you might expect it to return when the strings are equal.
strcmp(String_1, String_2, Limit)	The same as the two-argument strcmp except that at most Limit characters are compared.	If Limit is chosen carefully, this is safer than the two-argument version of strcmp. Not implemented in all versions of C++.

innovative • entrepreneurial • global

www.utm.my

String/Numeric Conversion Functions

- These functions convert between string and numeric forms of numbers
- Need to include **cstdlib** header file

FUNCTION	PARAMETER	ACTION
atoi	C-string	converts C-string to an int value, returns the value
atol	C-string	converts C-string to a long value, returns the value
atof	C-string	converts C-string to a double value, returns the value
itoa	int,C-string, int	converts 1 st int parameter to a C-string, stores it in 2 nd parameter. 3 rd parameter is base of converted value

innovative • entrepreneurial • global

www.utm.my

String/Numeric Conversion Functions

- `atoi` converts alphanumeric to int
- `atol` converts alphanumeric to long
- `atof` converts a numeric string to a double
- if C-string being converted contains non-digits, results are undefined
 - function may return result of conversion up to first non-digit
 - function may return 0

innovative • entrepreneurial • global www.utrm.my

String/Numeric Conversion Functions

- Examples:
 - `int number;`
 - `long lnumber;`
 - `double dnumber;`
 - `number = atoi("57");`
 - `lnumber = atol("50000");`
 - `dnumber = atof("590.55");`

innovative • entrepreneurial • global www.utrm.my

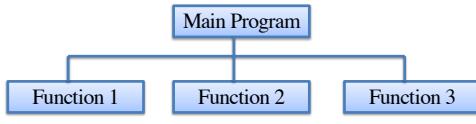

String/Numeric Conversion Functions

- `itoa` converts an int to an alphanumeric string
- Allows user to specify the base of conversion
`itoa(int num, char numStr, int base)`
 - `num`: number to convert
 - `numStr`: array to hold resulting string
 - `base`: base of conversion
- Example: To convert the number 1200 to a hexadecimal string
 - `char numStr[10];`
 - `itoa(1200, numStr, 16);`

innovative • entrepreneurial • global www.utrm.my

User-Defined Functions

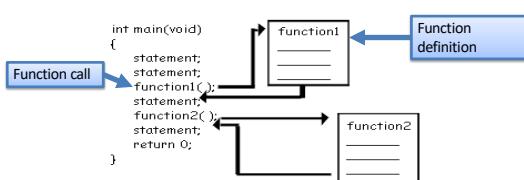

- User-defined functions are created by you, the programmer.
- Commonly used to break a problem down into small **manageable** pieces.
- You are already familiar with the one function that every C++ program possesses: `int main()`
 - Ideally, your `main()` function should be very short and should consist primarily of function calls.

innovative • entrepreneurial • global www.utrm.my

Defining and Calling Functions

- Every functions must have:
 - **Function call**: statement causes a function to execute
 - **Function definition**: statements that make up a function

```
int main(void)
{
    statement;
    statement;
    function1();
    statement;
    function2();
    statement;
    return 0;
}
```

innovative • entrepreneurial • global www.utrm.my

Function Definition

- Definition includes:
 - **return type**: data type of the value that function returns to the part of the program that calls it
 - **name**: name of the function. Function names follow same rules as variables
 - **parameter list**: variables containing values passed to the function
 - **body**: statements that perform the function's task, enclosed in {}

innovative • entrepreneurial • global www.utrm.my

Function Definition (cont.)

- The general form of a function definition in C++ is as follows:

```
function-returntype function-name( parameter-list )
{
    local-definitions;
    function-implementation;
}
```

Note: The line that reads `int main()` is the function header.

innovative • entrepreneurial • global www.utrm.my

Function Return Type

- If a function returns a value, the type of the value must be indicated:

```
int main()
```

- If a function does not return a value, its return type is void:

```
void printHeading()
{
    cout << "Monthly Sales\n";
}
```

innovative • entrepreneurial • global www.utrm.my

Calling a Function

- To call a function, use the function name followed by () and ;

```
printHeading();
```

- When called, program executes the body of the called function
- After the function terminates, execution resumes in the calling function at point of call.

innovative • entrepreneurial • global www.utrm.my

The Flowchart

innovative • entrepreneurial • global www.utrm.my

The Pseudo Code

- Start
- Print "Hello from main"
- call displayMessage
- Print "Back in function main again"
- End
- displayMessage:
 - Print "Hello from the function displayMessage"

innovative • entrepreneurial • global www.utrm.my

The Structure Chart

```
graph TD
    A[main_program] --> B[displayMessage]
```

innovative • entrepreneurial • global www.utrm.my

Calling a Function - Example

Program 6-1

```

1 // This program has two functions: main and displayMessage
2 #include <iostream>
3 using namespace std;
4
5 //*****
6 // Definition of function displayMessage *
7 // This function displays a greeting. *
8 //*****
9
10 void displayMessage()
11 {
12     cout << "Hello from the function displayMessage.\n";
13 }
14
15 //*****
16 // Function main
17 //*****
18
19 int main()
20 {
21     cout << "Hello from main.\n";
22     displayMessage();
23     cout << "Back in function main again.\n";
24     return 0;
25 }
```

Function definition

Function call

Program Output

```
Hello from main.
Hello from the function displayMessage.
Back in function main again.
```

innovative • entrepreneurial • global www.utm.my

Flow of Control in Program 6-1

```

graph TD
    A[void displayMessage() {
        cout << "Hello from the function displayMessage.\n";
    }]
    B[int main() {
        cout << "Hello from main.\n";
        A
        cout << "Back in function main again.\n";
        return;
    }]
```

innovative • entrepreneurial • global www.utm.my

User-Defined Functions: Example 2

```

01 #include <iostream>
02 #include <cmath>
03 using namespace std;
04
05 float distance(float x, float y)
06 {
07     float dist;
08     dist = sqrt(x * x + y * y);
09     return dist;
10 }
11 void main()
12 {
13     float x,y,dist;
14     cout << "Testing function distance(x,y)" << endl;
15     cout << "Enter values for x and y: ";
16     cin >> x >> y;
17     dist = distance(x,y);
18     cout << "Distance of (" << x << ',' << y << ") from origin is "
19     " << dist << endl << "Tested" << endl;
```

innovative • entrepreneurial • global www.utm.my

Calling Functions

- main can call any number of functions
- Functions can call other functions
- Compiler **must** know the following about a function before it is called:
 - name
 - return type
 - number of parameters
 - data type of each parameter

innovative • entrepreneurial • global www.utm.my

In-Class Exercise

- Do Lab 11, Exercise 1, No 1 (pg. 147-149)
- Which of the following function headers are valid? If they are invalid, explain why.
 - one (int a, int b)
 - int thisone(char x)
 - char another (int a, b)
 - double yetanother

innovative • entrepreneurial • global www.utm.my

Function Prototypes

- Ways to **notify the compiler** about a function before a call to the function:
 - Place function definition before calling function's definition
 - Use a function prototype (function declaration) – like the function definition without the body
 - Header: void printHeading()
 - Prototype: void printHeading();

innovative • entrepreneurial • global www.utm.my

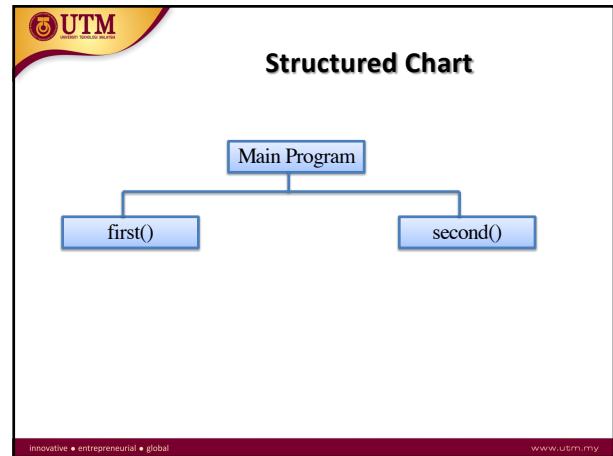

**User-Defined Functions:
Function Prototypes**

```

01 #include <iostream>
02
03 void first();           Function prototypes
04 void second();
05
06 void main()
07 {
08     cout<< "Starting in main function \n";
09     first();
10    second();
11    cout<<"Control back to main\n";
12 }
13
14 void first()
15 { cout<<"Inside the first function\n"; }
16
17 void second()
18 { cout<<"Inside the second function\n"; }

```

innovative • entrepreneurial • global www.utrm.my

Prototype Notes

- Place prototypes near **top** of program
- Program must include either prototype **or** full function definition before any call to the function – compiler error otherwise
- When using prototypes, can place function definitions in any order in source file

innovative • entrepreneurial • global www.utrm.my

**User-Defined Functions:
Functions with No Parameters**

```

01 #include <iostream>
02 void printhi();
03
04 void main(){
05     cout << "Testing function printhi()" << endl;
06     printhi();
07     cout << "Tested" << endl;
08 } // End of main
09
10 // Function Definitions
11 void printhi()
12 {
13     cout << "Hi \n";
14 }

```

innovative • entrepreneurial • global www.utrm.my

In-Class Exercise

- Do Lab 11, Exercise 3, No. 1 (pg. 163)

innovative • entrepreneurial • global www.utrm.my

Sending Data into a Function

- Can **pass values** into a function at time of call:
 $c = \text{pow}(a, b);$
- Values passed to function are arguments
- Variables in a function that **hold the values passed** as arguments are parameters

innovative • entrepreneurial • global www.utrm.my

UTM
UNIVERSITI TEKNOLOGI MARA

A Function with a Parameter Variable

```
01 void displayValue(int num)
02 {
03     cout << "The value is " << num << endl;
04 }
```

The integer variable num is a **parameter**. It accepts any integer value passed to the function.

innovative • entrepreneurial • global www.utrm.my

UTM
UNIVERSITI TEKNOLOGI MARA

User-Defined Functions: Functions with Parameter and No Return Values (1)

```
01 #include <iostream>
02 using namespace std;
03 void printhi(int);
04
05 void main(){
06     int n;
07     cout << "Enter a value for n: ";
08     cin >> n;
09     printhi(n);
10    cout << "Tested \n";
11 }
12 void printhi(int n)
13 {
14     int i;
15     for (i = 0; i < n; i++)
16         cout << "Hi \n";
17 }
```

14 {
15     cout << "The value is " << n << endl;
16 }
```

innovative • entrepreneurial • global www.utrm.my

UTM
UNIVERSITI TEKNOLOGI MARA

Other Parameter Terminology

- A parameter can also be called a formal parameter or formal argument
- An argument can also be called an actual parameter or an actual argument

innovative • entrepreneurial • global www.utrm.my

UTM
UNIVERSITI TEKNOLOGI MARA

Parameters, Prototypes, and Function Headers

- For each function argument,
 - the **prototype** must include the **data type** of each parameter inside its parentheses
 - the **header** must include a **declaration** for each parameter in its ()

```
void evenOrOdd(int); //prototype
void evenOrOdd(int num) //header
evenOrOdd(val); //call
```

innovative • entrepreneurial • global www.utrm.my

Function Call Notes

- Value of argument is **copied** into parameter when the function is called
- A parameter's scope is the function which uses it
- Function can have **multiple** parameters
- There **must** be a **data type** listed in the prototype () and an **argument declaration** in the function header () for each parameter
- Arguments will be promoted/demoted as necessary to **match** parameters

innovative • entrepreneurial • global

www.utm.my

In-Class Exercise

- What is the output of this program?

```

01 #include <iostream>
02
03 // Function prototype
04 void showDouble(int);
05
06 int main()
07 {
08     int num;
09     for (num = 0; num < 10; num++)
10         showDouble(num);
11     system("pause");
12     return 0;
13 }
14 //Definition of function
15 void showDouble(int value) {
16     cout << value << '\t';
17     cout << (value * 2) << endl;
18 }
```

Using Functions in Menu-Driven Programs

- Functions can be used
 - to implement user choices from menu
 - to implement general-purpose tasks:
 - Higher-level functions can call general-purpose functions, minimizing the total number of functions and speeding program development time
- See Program 6-10 in the text book (pg. 310-311)

The return Statement

- Used to end execution of a function
- Can be placed anywhere in a function
 - Statements that follow the `return` statement will not be executed
- Can be used to prevent abnormal termination of program
- In a `void` function without a `return` statement, the function ends at its last }

Returning a Value from a Function

- A function can return a value back to the statement that called the function.
- You've already seen the `pow` function, which returns a value:

```
double x;
x = pow(2.0, 10.0);
```

Returning a Value from a Function

- In a value-returning function, the `return` statement can be used to return a value from function to the point of call.

Example:

```
int sum(int num1, int num2)
{
    double result;
    result = num1 + num2;
    return result;
}
```

A Value-Returning Function

Return Type

```
int sum(int num1, int num2)
{
    double result;
    result = num1 + num2;
    return result;
}
```

Value Being Returned

A Value-Returning Function

```
int sum(int num1, int num2)
{
    return num1 + num2;
}
```

Functions can return the values of expressions, such as `num1 + num2`

The return Statement - Example

Program 6-11

```

1 // This program uses a function to perform division. If division
2 // by zero is detected, the function returns.
3 #include <iostream>
4 using namespace std;
5
6 // Function prototype.
7 void divide(double, double);
8
9 int main()
10 {
11     double num1, num2;
12
13     cout << "Enter two numbers and I will divide the first\n";
14     cout << "number by the second number: ";
15     cin >> num1 >> num2;
16     divide(num1, num2);
17     return 0;
18 }
```

innovative • entrepreneurial • global www.utm.my

The return Statement - Example

Program 6-11(Continued)

```

20 //*****
21 // Definition of function divide.
22 // Uses two parameters: arg1 and arg2. The function divides arg1*
23 // by arg2 and shows the result. If arg2 is zero, however, the *
24 // function returns.
25 //*****
26
27 void divide(double arg1, double arg2)
28 {
29     if (arg2 == 0.0)
30     {
31         cout << "Sorry, I cannot divide by zero.\n";
32         return;
33     }
34     cout << "The quotient is " << (arg1 / arg2) << endl;
35 }
```

Return to called function

Program Output with Example Input Shown in Bold

```

Enter two numbers and I will divide the first
number by the second number: 12 0 [Enter]
Sorry, I cannot divide by zero.
```

innovative • entrepreneurial • global www.utm.my

Returning a Value From a Function

Program 6-12

```

1 // This program uses a function that returns a value.
2 #include <iostream>
3 using namespace std;
4
5 // Function prototype
6 int sum(int, int);
7
8 int main()
9 {
10     int value1 = 20,    // The first value
11     value2 = 40,      // The second value
12     total;           // To hold the total
13
14     // Call the sum function, passing the contents of
15     // value1 and value2 as arguments. Assign the return
16     // value to the total variable.
17     total = sum(value1, value2);
18
19     // Display the sum of the values.
20     cout << "The sum of " << value1 << " and "
21     << value2 << " is " << total << endl;
22     return 0;
23 }
```

innovative • entrepreneurial • global www.utm.my

Returning a Value From a Function

Program 6-12 (Continued)

```

24 //*****
25 //*****
26 // Definition of function sum. This function returns *
27 // the sum of its two parameters.
28 //*****
29
30 int sum(int num1, int num2)
31 {
32     return num1 + num2;
33 }
```

Program Output

```

The sum of 20 and 40 is 60
```

innovative • entrepreneurial • global www.utm.my

The Structure Chart

```

graph TD
    MP[main_program] --> V1[value1]
    MP --> V2[value2]
    V1 --> S[sum]
    V2 --> S
    S --> T[total]

```

innovative • entrepreneurial • global www.utm.my

Returning a Value From a Function

```

total = sum(value1, value2);
          +-----+
          |       |
          |       40
          +-----+
          |       |
          |       20
          +-----+
          |       |
          |       int sum(int num1, int num2)
          |       {
          |           return num1 + num2;
          |       }

```

The statement in line 17 calls the sum function, passing value1 and value2 as arguments. The return value is assigned to the total variable.

innovative • entrepreneurial • global www.utm.my

Returning a Value From a Function

- The prototype and the definition must indicate the data type of return value (not `void`)
- Calling function should use return value:
 - assign it to a variable
 - send it to `cout`
 - use it in an expression

innovative • entrepreneurial • global

www.utrm.my

Returning a Boolean Value

- Function can return `true` or `false`
- Declare return type in function prototype and heading as `bool`
- Function body must contain `return` statement(s) that return `true` or `false`
- Calling function can use return value in a relational expression

innovative • entrepreneurial • global

www.utrm.my

Returning a Boolean Value

Program 6-14

```

1 // This program uses a function that returns true or false.
2 #include <iostream>
3 using namespace std;
4
5 // Function prototype
6 bool isEven(int);
7
8 int main()
9 {
10     int val;
11
12     // Get a number from the user.
13     cout << "Enter an integer and I will tell you ";
14     cout << "if it is even or odd: ";
15     cin >> val;
16

```

innovative • entrepreneurial • global

www.utrm.my

Returning a Boolean Value

Program 6-14 (continued)

```

17     // Indicate whether it is even or odd.
18     if (isEven(val))
19         cout << val << " is even.\n";
20     else
21         cout << val << " is odd.\n";
22     return 0;
23 }
24
25 //*****
26 // Definition of function isEven. This function accepts an *
27 // integer argument and tests it to be even or odd. The function *
28 // returns true if the argument is even or false if the argument *
29 // is odd. The return value is an bool.
30 //*****
31
32 bool isEven(int number)
33 {
34     bool status;
35
36     if (number % 2)
37         status = false; // number is odd if there's a remainder.
38     else
39         status = true; // Otherwise, the number is even.
40
41 }

```

Program Output with Example Input Shown in Bold
 Enter an integer and I will tell you if it is even or odd: 5 [Enter]
 5 is odd.

innovative • entrepreneurial • global

www.utrm.my

In-Class Exercise

```

#include <iostream>
using namespace std;
void try1(int p);
int try3(int r);

int main()
{ int a=2;
  cout << a << endl;
  try1(a);
  cout << a << endl;
  int b=3;
  cout << b << endl;
  try3(c);
  cout << c << endl;
  cout << try3(5) << endl;
  return 0;
}

```

innovative • entrepreneurial • global

www.utrm.my

In-Class Exercise

- Do Lab 11, Exercise 2, No. 2 – Program 11.9 (pg. 159)
- Do Lab 11, Exercise 2, No. 3 (pg. 164)
- Write a function prototype and header for a function named `distance`. The function should return a `double` and have a two `double` parameters: `rate` and `time`.
- Write a function prototype and header for a function named `days`. The function should return an `integer` and have three `integer` parameters: `years`, `months` and `weeks`.
- Examine the following function header, then write an example call to the function.
 - `void showValue(int quantity)`

innovative • entrepreneurial • global

www.utrm.my

In-Class Exercise

- The following statement calls a function named `half`. The `half` function returns a value that is half that of the argument. Write the function.

```
result = half(number);
```

- A program contains the following function:

```
int cube (int num)
{
    return num*num*num;
}
```

Write a statement that passes the value 4 to this function and assigns its return value to the variable `result`.

In-Class Exercise

- Write a C++ program to calculate a rectangle's area. The program consists of the following functions:

- `getLength` – This function should ask the user to enter the rectangle's length, and then returns that value as a double.
- `getWidth` – This function should ask the user to enter the rectangle's width, and then returns that value as a double.
- `getArea` – This function should accept the rectangle's length and width as arguments and return the rectangle's area.
- `displayData` – This function should accept the rectangle's length, width and area as arguments, and display them in an appropriate message on the screen.
- `main` – This function consists of calls to the above functions.

Local and Global Variables

- Variables defined inside a function are *local* to that function. They are hidden from the statements in other functions, which normally cannot access them.
- Because the variables defined in a function are hidden, other functions may have separate, distinct variables with the same name.

Local and Global Variables - Example

Program 6-15

```
1 // This program shows that variables defined in a function
2 // are hidden from other functions.
3 #include <iostream>
4 using namespace std;
5
6 void anotherFunction(); // Function prototype
7
8 int main()
9 {
10     int num = 1; // Local variable
11
12     cout << "In main, num is " << num << endl;
13     anotherFunction();
14     cout << "Back in main, num is " << num << endl;
15     return 0;
16 }
17
18 //*****
19 // Definition of anotherFunction
20 // It has a local variable, num, whose initial value *
21 // is 20. This is hidden from main.
22 //*****
23
24 void anotherFunction()
25 {
26     int num = 20; // Local variable
27
28     cout << "In anotherFunction, num is " << num << endl;
29 }
```

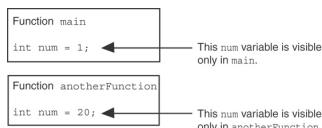

Program Output

```
In main, num is 1
In anotherFunction, num is 20
Back in main, num is 1
```

Local and Global Variables - Example

- When the program is executing in `main`, the `num` variable defined in `main` is visible.
- When `anotherFunction` is called, however, only variables defined inside it are visible, so the `num` variable in `main` is hidden.

Local Variable Lifetime

- A function's local variables exist only while the **function is executing**. This is known as the *lifetime* of a local variable.
- When the function begins, its local variables and its parameter variables are **created** in memory, and when the function ends, the local variables and parameter variables are **destroyed**.
- This means that any value stored in a local variable is lost between calls to the function in which the variable is declared.

Global Variables and Global Constants

- A **global** variable is any variable defined **outside** all the functions in a program.
- The scope of a global variable is the portion of the program from the variable definition to the end.
- This means that a global variable can be accessed by **all** functions that are defined after the global variable is defined

innovative • entrepreneurial • global www.utrm.my

Global Variables and Global Constants

- You should **avoid** using global variables because they make programs difficult to debug.
- Any global that you create should be **global constants**.

innovative • entrepreneurial • global www.utrm.my

Global Constants – Example

Program 6-18

```

1 // This program calculates gross pay
2 #include <iostream>
3 #include <iomanip>
4 using namespace std;
5
6 // Global constants
7 const double PAY_RATE = 22.55;      // Hourly pay rate
8 const double BASE_HOURS = 40.0;     // Max non-overtime hours
9 const double OT_MULTIPLIER = 1.5;    // Overtime multiplier
10
11 // Function prototypes
12 double getBasePay(double);
13 double getOvertimePay(double);
14
15 int main()
16 {
17     double hours,           // Hours worked
18         basePay,           // Base pay
19         overtime = 0.0,    // Overtime pay
20         totalPay;          // Total pay

```

Global constants defined for values that do not change throughout the program's execution.

innovative • entrepreneurial • global www.utrm.my

Global Constants – Example

The constants are then used for those values throughout the program.

```

56 // Get overtime pay, if any.
57 if (hoursWorked > BASE_HOURS)
58     overtime = getOvertimePay(hours);
59 else
60     overtime = 0.0;
61
62 // Determine base pay.
63 if (hoursWorked > BASE_HOURS)
64     basePay = BASE_HOURS * PAY_RATE;
65 else
66     basePay = hoursWorked * PAY_RATE;
67
68 // Determine overtime pay.
69 if (hoursWorked > BASE_HOURS)
70 {
71     overtimePay = (hoursWorked - BASE_HOURS) *
72                     PAY_RATE * OT_MULTIPLIER;
73 }
74
75
76
77
78
79

```

innovative • entrepreneurial • global www.utrm.my

Initializing Local and Global Variables

- Local variables are not automatically initialized. They must be initialized by programmer.
- Global variables (not constants) are automatically initialized to 0 (numeric) or NULL (character) when the variable is defined.

innovative • entrepreneurial • global www.utrm.my

In-Class Exercise

- Do Lab 11, Exercise 1, No. 17 (pg. 155 -156)

innovative • entrepreneurial • global www.utrm.my

Static Local Variables

- Local variables only exist while the function is executing. When the function terminates, the contents of local variables are lost.
- `static` local variables retain their contents between function calls.
- `static` local variables are defined and initialized only the first time the function is executed. 0 is the default initialization value.

innovative • entrepreneurial • global

www.utrm.my

Local Variables - Example

Program 6-20

```

1 // This program shows that local variables do not retain
2 // their values between function calls.
3 #include <iostream>
4 using namespace std;
5
6 // Function prototype
7 void showLocal();
8
9 int main()
10 {
11     showLocal();
12     showLocal();
13     return 0;
14 }
15

```

innovative • entrepreneurial • global

www.utrm.my

Local Variables - Example

Program 6-20

(continued)

```

16 //*****
17 // Definition of function showLocal.
18 // The initial value of localNum, which is 5, is displayed. *
19 // The value of localNum is then changed to 99 before the * 
20 // function returns. *
21 //*****
22
23 void showLocal()
24 {
25     int localNum = 5; // Local variable
26
27     cout << "localNum is " << localNum << endl;
28     localNum = 99;
29 }

```

Program Output

localNum is 5

localNum is 5

In this program, each time `showLocal` is called, the `localNum` variable is re-created and initialized with the value 5.

innovative • entrepreneurial • global

www.utrm.my

A Different Approach, Using a Static Variable

Program 6-21

```

1 // This program uses a static local variable.
2 #include <iostream>
3 using namespace std;
4
5 void showStatic(); // Function prototype
6
7 int main()
8 {
9     // Call the showStatic function five times.
10    for (int count = 0; count < 5; count++)
11        showStatic();
12    return 0;
13 }
14

```

Using a Static Variable - Example

Program 6-21

(continued)

```

15 //*****
16 // Definition of function showStatic.
17 // statNum is a static local variable. Its value is displayed. *
18 // and then incremented just before the function returns. *
19 //*****
20
21 void showStatic()
22 {
23     static int statNum;
24
25     cout << "statNum is " << statNum << endl;
26     statNum++;
27 }

```

Program Output

statNum is 0 → statNum is automatically initialized to 0. Notice that it retains its value between function calls.

innovative • entrepreneurial • global

www.utrm.my

Using a Static Variable - Example

If you do initialize a local static variable, the initialization only happens once. See Program 6-22...

Program 6-22

(continued)

```

16 //*****
17 // Definition of function showStatic.
18 // statNum is a static local variable. Its value is displayed. *
19 // and then incremented just before the function returns. *
20 //*****
21
22 void showStatic()
23 {
24     static int statNum = 5;
25
26     cout << "statNum is " << statNum << endl;
27     statNum++;
28 }

```

Program Output

statNum is 5
statNum is 5
statNum is 7
statNum is 8
statNum is 9

In-Class Exercise

- Given the following programs compare the output and reason the output.

```
#include <iostream>
using namespace std;

void showVar();

int main () {
    for (int count=0;count<10; count++)
        showVar();
    system("pause");
    return 0;
}

void showVar() {
    static int var = 10;
    cout << var << endl;
    var++;
}
```

innovative • entrepreneurial • global

www.utrm.my

```
#include <iostream>
using namespace std;

void showVar();

int main () {
    for(int count=0;count<10; count++)
        showVar();
    system("pause");
    return 0;
}

void showVar() {
    int var = 10;
    cout << var << endl;
    var++;
}
```

In-Class Exercise

- Identify global variables & local variables in the following program. What is the output?

```
#include <iostream>
using namespace std;
int j = 8;

int main()
{
    int i=0;
    cout<<"i: "<<i<<endl;
    cout<<"j: "<<j<<endl;
    system("pause");
    return 0;
}
```

innovative • entrepreneurial • global

www.utrm.my

- Identify global variables, local variables and static local variables in the following program. What is the output?

```
#include <iostream>
using namespace std;
int j = 40;

void p()
{
    int i=5;
    static int j=5;
    i++;
    j++;
    cout<<"i: "<<i<<endl;
    cout<<"j: "<<j<<endl;
}

int main()
{
    p();
    p();
    return 0;
}
```

innovative • entrepreneurial • global

www.utrm.my

Using Reference Variables as Parameters

- A mechanism that allows a function to work with the **original argument** from the function call, not a copy of the argument
- Allows the function to **modify values** stored in the calling environment
- Provides a way for the function to 'return' more than one value

innovative • entrepreneurial • global

www.utrm.my

Passing by Reference

- A reference variable** is an alias for another variable
- Defined with an ampersand (&)
- Changes to a reference variable are made to the variable it refers to
- Use reference variables to implement passing parameters *by reference*

innovative • entrepreneurial • global

www.utrm.my

Passing by Reference – Example

The & here in the prototype indicates that the parameter is a reference variable.

Program 6-24

```
1 // This program uses a reference variable as a function
2 // parameter.
3 #include <iostream>
4 using namespace std;
5
6 // Function prototype The parameter is a reference variable.
7 void doubleNum(int &);
8
9 int main()
10 {
11     int value = 4;
12
13     cout << "In main, value is " << value << endl;
14     cout << "Now calling doubleNum..." << endl;
15     doubleNum(value);
16     cout << "Now back in main. value is " << value << endl;
17
18 }
```

innovative • entrepreneurial • global

www.utrm.my

Here we are passing value by reference.

UTM
UNIVERSITI TEKNOLOGI MARA

Passing by Reference - Example

Program 6-24 (Continued)

The & also appears here in the function header.

```

20 //***** Definition of doubleNum. *
21 // The parameter refVar is a reference variable. The value *
22 // in refVar is doubled. *
23 //***** *
24 //***** void doubleNum (int &refVar)
25 //***** *
26 void doubleNum (int &refVar)
27 {
28     refVar *= 2;
29 }
```

Program Output

```
In main, value is 4
Now calling doubleNum...
Now back in main. value is 8
```

innovative • entrepreneurial • global www.utm.my

UTM
UNIVERSITI TEKNOLOGI MARA

Reference Variables Notes

- Each reference parameter must contain &
- Space between type and & is unimportant
- Must use & in both prototype and header
- Argument passed to reference parameter must be a variable – cannot be an expression or constant
- Use when appropriate – don't use when argument should not be changed by function, or if function needs to return only 1 value

innovative • entrepreneurial • global www.utm.my

    cout<<a<<" "<<b<<" "<<c<<" "
        <<d<<endl;
    cout<<a+b+c-d;
    test(a,b,c,d);
    cout<<a<<" "<<b<<" "<<c<<" "
        <<d<<endl;
    return 0;
}
```

The input:
6 8 12 35
8 9 30 45

innovative • entrepreneurial • global www.utm.my

UTM
UNIVERSITI TEKNOLOGI MARA

Default Arguments

- A Default argument is an argument that is passed automatically to a parameter if the argument is missing on the function call.
- Must be a constant declared in prototype:

```
void evenOrOdd(int = 0);
```
- Can be declared in header if no prototype
- Multi-parameter functions may have default arguments for some or all of them:

```
int getSum(int, int=0, int=0);
```

innovative • entrepreneurial • global www.utm.my

Default Arguments – Example

Default arguments specified in the prototype

Program 6-23

```

1 // This program demonstrates default function arguments.
2 #include <iostream>
3 using namespace std;
4
5 // Function prototype with default arguments
6 void displayStars(int cols = 10, int rows = 1);
7
8 int main()
9 {
10    displayStars();      // Use default values for cols and rows.
11    cout << endl;
12    displayStars(5);    // Use default value for rows.
13    cout << endl;
14    displayStars(7, 3); // Use 7 for cols and 3 for rows.
15    return 0;
16 }
```

(Program Continues)

Default Arguments – Example

Program 6-23 (Continued)

```

18 ****
19 // Definition of function displayStars.
20 // The default argument for cols is 10 and for rows is 1. *
21 // This function displays a square made of asterisks. *
22 ****
23
24 void displayStars(int cols, int rows)
25 {
26    // Nested loop. The outer loop controls the rows.
27    // and the inner loop controls the columns.
28    for (int down = 0; down < rows; down++)
29    {
30        for (int across = 0; across < cols; across++)
31            cout << "*";
32        cout << endl;
33    }
34 }
```

Program Output

```
*****
*****
*****
*****
```

Default Arguments

- If not all parameters to a function have default values, the defaultless ones are declared first in the parameter list:

```

int getSum(int, int=0, int=0); // OK
int getSum(int, int=0, int); // NO
```

- When an argument is omitted from a function call, all arguments after it must also be omitted:

```

sum = getSum(num1, num2); // OK
sum = getSum(num1, , num3); // NO
```

Default Arguments

- Consider the following function prototype:
`void funcExp(int, int, double=55.5, char='A');`
- The following function calls are legal:
 - `funcExp(3, 4, 45.5, 'B');`
 - `funcExp(3, 4, 45.5);`
 - `funcExp(3, 4);`
- The following function calls are illegal:
 - `funcExp(3, 4, 'C');`

Default Arguments

- The following are illegal function prototypes with default arguments:
 - `void funcOne(int, double=23.45, char, int=45);`
 - `int funcTwo(int=1, int, int=1);`
 - `void funcThree(int, int&=16, double=34);`

In-Class Exercise

- Do Lab 11, Exercise 2, No. 5 (pg. 160)

• Consider the following function prototype & function definition:

```
void testDefaultParam(int , int=5, double=3.2);

void testDefaultParam(int a, int b, double z)
{
    int u;
    a=a+static_cast<int>(2*b+z);
    u=a+b*z;
    cout<<"u = "<<a<<endl;
}
```

What is the output of the following function calls?

- testDefaultParam(6);
- testDefaultParam(3,4);
- testDefaultParam(3,4,5);
- testDefaultParam(3,4, 5.5);
- testDefaultParam(3,4);

In-Class Exercise

- Write a function prototype and function header for a function called `compute`. The function should have 3 parameters: an `int`, a `double` and a `long`. The `int` parameter should have a default argument of 5, and the `long` parameter should have a default argument of 65536. The `double` parameter should have no default arguments. The parameters no necessarily in the order.
- Write a function prototype and function header for a function called `calculate`. The function should have 3 parameters: an `int`, a reference to a `double` and a `long`. Only the `int` parameter should have a default argument, which is 47. The parameters no necessarily in the order.

innovative • entrepreneurial • global

www.utm.my

Overloading Functions

- Overloaded functions have the same name but different parameter lists
- Can be used to create functions that perform the same task but take **different parameter types or different number of parameters**
- Compiler will determine which version of function to call by argument and parameter lists

innovative • entrepreneurial • global

www.utm.my

Function Overloading Examples

- Using these overloaded functions,

```
void getDimensions(int);           // 1
void getDimensions(int, int);      // 2
void getDimensions(int, double);   // 3
void getDimensions(double, double); // 4
```

- the compiler will use them as follows:

```
int length, width;
double base, height;
getDimensions(length);           // 1
getDimensions(length, width);    // 2
getDimensions(length, height);   // 3
getDimensions(base, height);     // 4
```

innovative • entrepreneurial • global

www.utm.my

Function Overloading – Example

Program 6-26

```
1 // This program uses overloaded functions.
2 #include <iostream>
3 #include <cmath>
4 using namespace std;
5
6 // Function prototypes
7 int square(int);
8 double square(double);
9
10 int main()
11 {
12     int userInt;
13     double userFloat;
14
15     // Get an int and a double.
16     cout << fixed << showpoint << setprecision(2);
17     cout << "Enter an integer and a floating-point value: ";
18     cin >> userInt >> userFloat;
19
20     // Display their squares.
21     cout << "Here are their squares: ";
22     cout << square(userInt) << " and " << square(userFloat);
23     return 0;
24 }
```

The overloaded functions have different parameter lists

Passing an int

Passing a double

(Program Continues)

innovative • entrepreneurial • global

www.utm.my

Function Overloading – Example

Program 6-26 (Continued)

```
26 ****
27 // Definition of overloaded function square.
28 // This function uses an int parameter, number. It returns the *
29 // square of number as an int.
30 ****
31
32 int square(int number)
33 {
34     return number * number;
35 }
36
37 ****
38 // Definition of overloaded function square.
39 // This function uses a double parameter, number. It returns *
40 // the square of number as a double.
41 ****
42
43 double square(double number)
44 {
45     return number * number;
46 }
```

Program Output with Example Input Shown In Bold
 Enter an integer and a floating-point value: **12 4.2 [Enter]**
 Here are their squares: 144 and 17.64

innovative • entrepreneurial • global

www.utm.my

The exit() Function

- **Terminates** the execution of a program
- Can be called from any function
- Can pass an **int** value to operating system to indicate status of program termination
- Usually used for **abnormal termination** of program
- Requires **cstdlib** header file (Borland)

innovative • entrepreneurial • global www.utm.my

The exit() Function

- Example:
`exit(0);`
- The **cstdlib** header defines two constants that are commonly passed, to indicate success or failure:
`exit(EXIT_SUCCESS);`
`exit(EXIT_FAILURE);`

innovative • entrepreneurial • global www.utm.my

In-Class Exercise

- What is the output for the following programs

```
#include <iostream>
using namespace std;
void function();
int main()
{
    function();
    cout << "Bye from main.\n";
    system ("pause"); return 0;
}

void function()
{
    cout << "Bye! from function
before exit\n";
    exit(0);
    cout << "Bye! from function
before exit\n";
}
```

```
#include <iostream>
using namespace std;
int function();
int main()
{
    function();
    cout << "Bye from main.\n";
    system ("pause"); return 0;
}

int function()
{
    cout << "Bye! from function
before return\n";
    return 0;
    cout << "Bye! from function
before return\n";
}
```

innovative • entrepreneurial • global www.utm.my

In-Class Exercise

- Do Lab 11, Exercise 2, No. 7 (pg. 162)
- Do Lab 11, Exercise 3, No. 5 (pg. 165)

innovative • entrepreneurial • global www.utm.my

In-Class Exercise

- Write a program that calculates the average of a group of test scores, where the lowest score in the group is dropped. It should use the following functions:
 - **getScore** – This function ask the user for a test score, store it in a reference parameter variable, and validate it. For input validation, do not accept test scores lower than 0 or higher than 100. This function should be called by **main()** once for each of the five scores to be entered.
 - **calcAverage** – This function calculates and display the average of the four highest score. This function should be called just once by **main()**, by should be passed the five scores.
 - **findLowest** – This function finds and returns the lowest of the five scores passed to it. It should be called by **calcAverage** function, which uses the function to determine which of the five scores to drop.
