HYPOTHESIS TESTING

1. Identify the specific claim or hypothesis to be tested and put it in symbolic form.
 2. Give the symbolic form that must be true when the original claim is false.
 3. Of the two symbolic expressions obtained so far, let the null hypothesis H_0 be the one that contains the condition of equality; H_1 is the other statement.
 4. Select the significance level α based on the seriousness of a type I error. Make α small if the consequences of rejecting a true H_0 are severe. The values of 0.05 and 0.01 are very common.
 5. Identify the statistic that is relevant to this test, and identify its sampling distribution.
 6. Determine the test statistic and either the P -value or the critical values, and the critical region. Draw a graph.
 7. Reject H_0 : Test statistic is in the critical region or $P\text{-value} \leq \alpha$. Fail to reject H_0 : Test statistic is not in the critical region or $P\text{-value} > \alpha$.
 8. Restate this previous conclusion in simple, nontechnical terms.
