

CHAPTER 5

# The Link Layer

*Our goals:*

- ❖ understand principles behind link layer services:
  - error detection, correction
  - sharing a broadcast channel: multiple access
  - link layer addressing
  - Local Area Networks: Ethernet, VLANs
- ❖ Instantiation (provide tangible example), implementation of various link layer technologies

5-2

CHAPTER **5** The Link Layer

Roadmap:

5.1 Introduction, services	5.5 Data center networking
5.2 Error detection, correction	5.6 A day in the life of a web request
5.3 Multiple access protocols	
<b>5.4 LANs</b>	
<ul style="list-style-type: none"> <li>▪ Addressing, ARP</li> <li>▪ Ethernet</li> <li>▪ Switches</li> <li>▪ VLANs</li> </ul>	

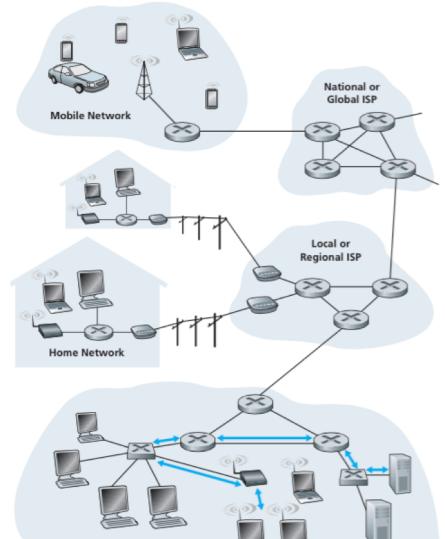

5-3

CHAPTER **5** (5.1) Introduction

*Terminology:*

- ❖ hosts and routers: \_\_\_\_\_
- ❖ communication channels that connect adjacent nodes along communication path: \_\_\_\_\_
  - wired links
  - wireless links
  - LANs
- ❖ layer-2 packet: \_\_\_\_\_, encapsulates datagram

*Data-link layer* has responsibility of transferring frame from one node to *physically adjacent* node over a link

**Figure:** Six link-layer hops between wireless host and server.

CHAPTER **5** Link Layer: Context

- ❖ **Frames** transferred by different link protocols over different links:
  - e.g., Ethernet on first link, frame relay on intermediate links, 802.11 (WiFi) on last link
- ❖ Each link protocol provides different services
  - e.g., may or may not provide `rdt` over link

*Transportation analogy:*

- ❖ Trip from Princeton to Lausanne
  - Limo : Princeton to JFK
  - Plane : JFK to Geneva
  - Train : Geneva to Lausanne
- ❖ Tourist = **frame**
- ❖ Transport segment = **communication link**
- ❖ Transportation mode = **link layer protocol**
- ❖ Travel agent = **routing algorithm**

JFK (John F. Kennedy, New York)

5-5

CHAPTER **5** Link Layer Services

- ❖ *Framing, Link access:*
  - encapsulate \_\_\_\_\_ into \_\_\_\_\_, adding header, trailer
  - channel access if shared medium
  - “MAC” addresses (e.g.: 74-29-2F-10-54-1A-FF-0F)  
used in **frame headers** to identify **source, destination**
    - different from IP address (e.g.: 161.139.68.204)!
- ❖ *Reliable delivery between adjacent nodes:*
  - we learned how to do this already (chapter 3)!
  - seldom used on low bit-error link (fiber, some twisted pair)
  - wireless links: high error rates

MAC (Medium Access Control)

5-6

# CHAPTER 5

# Link Layer Services

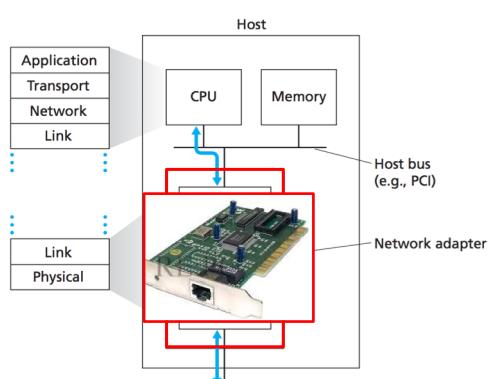

- ❖ *Flow control:*
  - pacing between adjacent sending and receiving nodes
- ❖ *Error \_\_\_\_\_:*
  - errors caused by signal attenuation, noise.
  - receiver detects presence of errors:
    - signals sender for retransmission or drops frame
- ❖ *Error \_\_\_\_\_:*
  - receiver identifies **and corrects** bit error(s) without resorting to retransmission
- ❖ *Half-duplex and full-duplex*
  - with half duplex, nodes at both ends of link can transmit, but not at same time

5-7

# CHAPTER 5

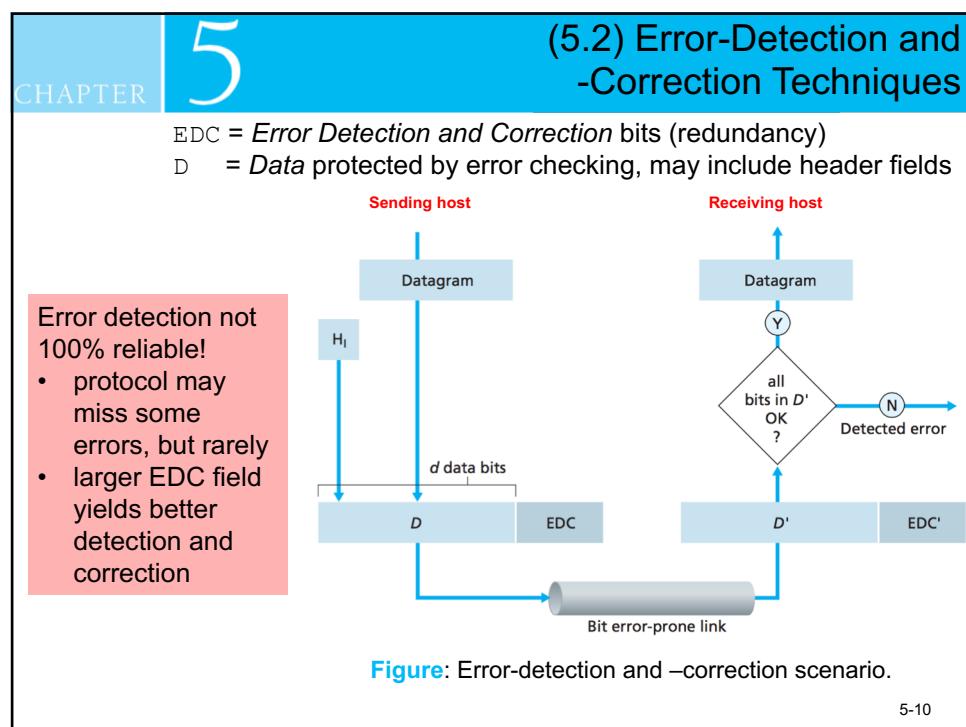

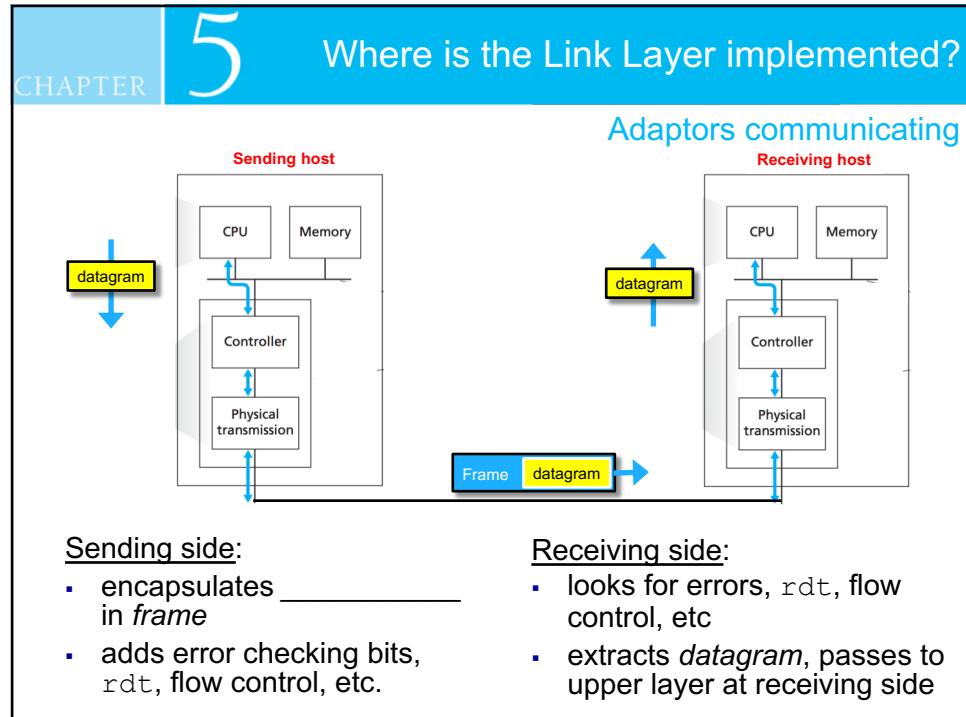

# Where is the Link Layer implemented?

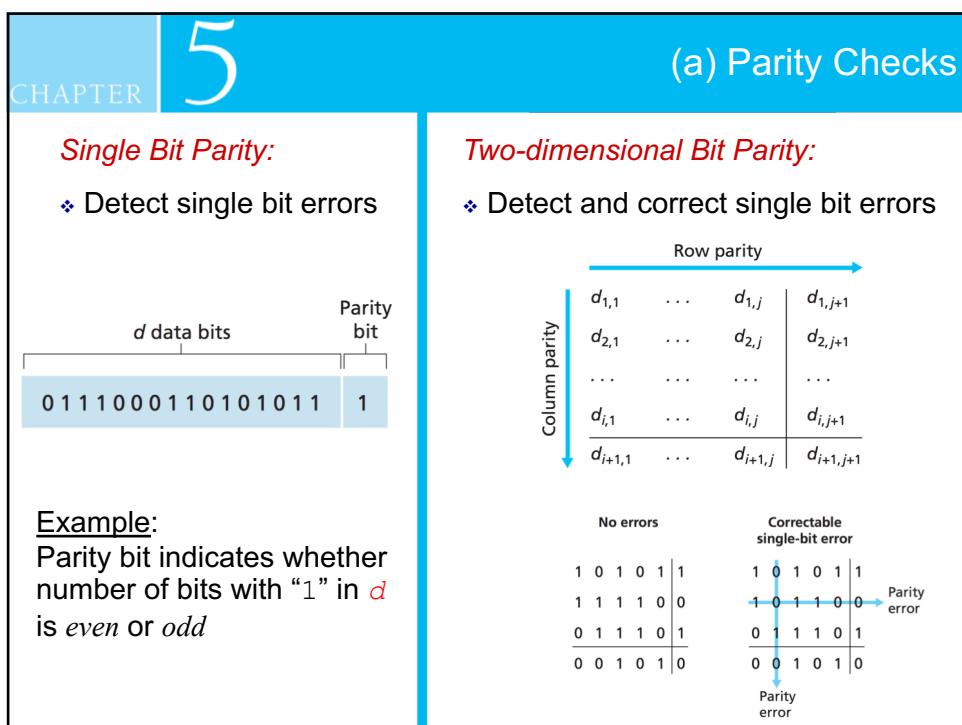

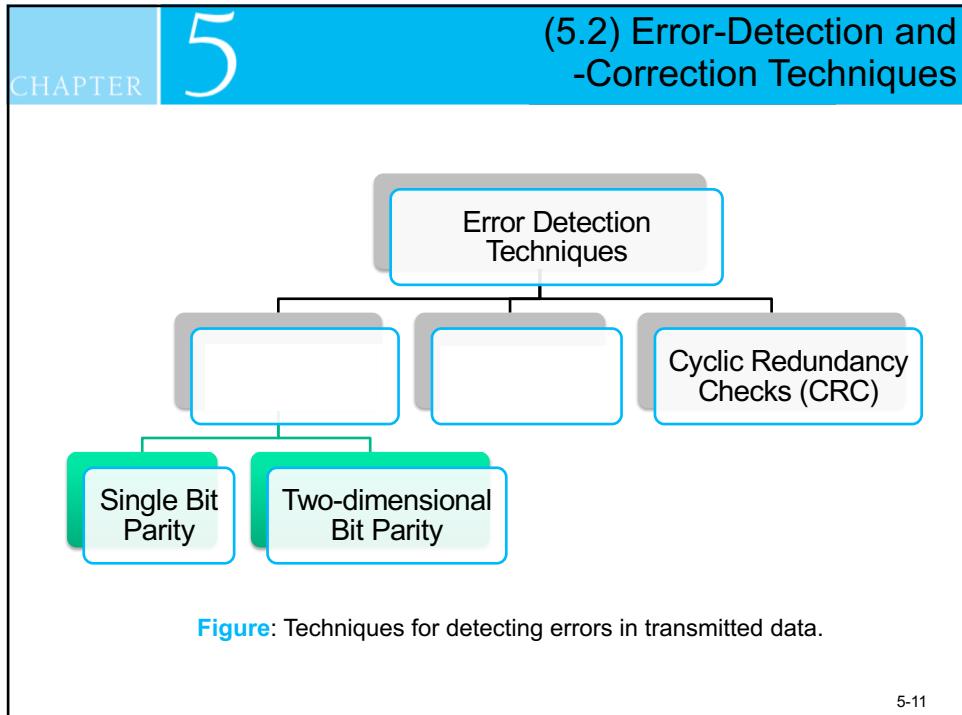

- ❖ in each and every host
- ❖ link layer implemented in “adaptor” (aka **(NIC)**) or on a chip
  - Ethernet card (wired), 802.11 card (wireless); Ethernet chipset
  - implements link, physical layer
- ❖ attaches into host’s system buses
- ❖ combination of hardware, software, firmware

**Figure:** Network adapter: its relationship to other host components and to protocol stack functionality.

5-8

CHAPTER **5** (b) Internet Checksum

**Goal:**  
Detect “errors” (e.g., flipped bits) in transmitted segment  
(Note: used at transport layer only)

**Review**

**Sender:**

- ❖ treat segment contents, including header fields, as sequence of 16-bit integers
- ❖ \_\_\_\_\_: addition (one's complement sum) of segment contents
- ❖ sender puts checksum value into UDP checksum field

**Receiver:**

- ❖ compute checksum of received segment
- ❖ check if computed checksum **equals checksum** field value:
  - NO - error detected
  - YES - no error detected.

5-13

CHAPTER **5** (c) Cyclic Redundancy Check (CRC)

- ❖ more powerful error-detection coding
- ❖ view data bits,  $D$ , as a binary number
- ❖ choose  $r+1$  bit pattern (generator),  $G$
- ❖ Goal: choose  $r$  CRC bits,  $R$ , such that
  - $\langle D, R \rangle$  exactly divisible by  $G$  (modulo 2)
  - receiver knows  $G$ , divides  $\langle D, R \rangle$  by  $G$ .  
If non-zero remainder: **Error detected!**
  - can detect all burst errors less than  $r+1$  bits
- ❖ widely used in practice (Ethernet, 802.11 WiFi, ATM)

$d$ bits	$r$ bits	
$D$ : Data bits to be sent		$R$ : CRC bits
$D \bullet 2^r$ XOR $R$		Bit pattern
		Mathematical formula

CHAPTER **5** (c) Cyclic Redundancy Check (CRC)

- 1) Agree with receiver that  $r = 3$  bits
- 2) Append 3 zeros to  $D$   
→  $101110000$
- 3) Agree on  $G$  (must be  $r+1 = 4$  bits). Can choose from  $\{1000, 1001, 1010, 1011, 1100, 1101, 1110, 1111\}$   
→ Choose  $1001$
- 4) Get  $R$  ( $r$  bits)
- 5) Append  $R$  to  $D$ . Send to receiver

Example: Sender

Subtraction of  $1011 - 1001$   
=  $1011 \text{ XOR } 1001$

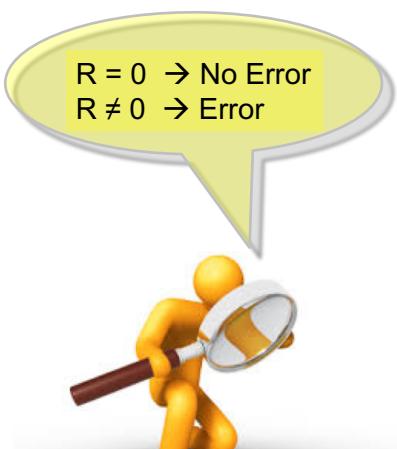

$  \begin{array}{r}  1001 \\  \times 1011 \\  \hline  1001 \\  1001 \\  \hline  1010 \\  1001 \\  \hline  000 \\  1010 \\  1001 \\  \hline  011  \end{array}  $	$  \begin{array}{r}  1011 \\  - 1001 \\  \hline  011  \end{array}  $
---	--

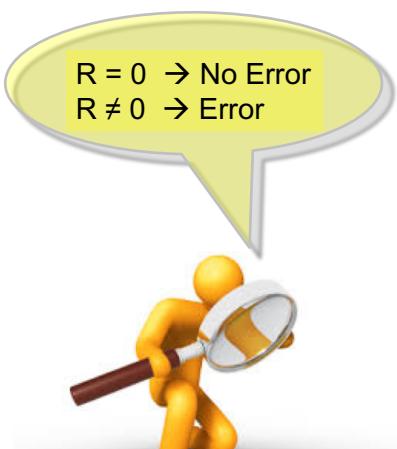

What's transmitted ? **101110011**

CHAPTER **5** (c) Cyclic Redundancy Check (CRC)

Example: Receiver

$R = 0 \rightarrow \text{No Error}$   
 $R \neq 0 \rightarrow \text{Error}$

$101110011$

$1001 \longleftarrow G$

$101011$

$1001$

$101$

$000$

$1010$

$1001$

$110$

$000$

$1101$

$1001$

$1001$

$1001$

$000$

$R \longleftarrow R$

CHAPTER

5

Exercise 5.1

If the data to be sent is 101110 and the CRC technique is used with  $r = 3$  and  $G = 1010$ .

- a) What is the value of  $R$  ?
- b) What is the data will be sent?

CHAPTER

5

Exercise 5.2

If the data received is 1011101100 and the CRC technique is used with  $G = 10100$ .

- a) What is the value of CRC?
- b) Is the data error?

(for example, cable access network)

Shared wireless  
(for example, WiFi)

Satellite

Cocktail party

Figure: Broadcast: Various multiple access channels.

5-20

CHAPTER **5** (5.3) Multiple Access Links & Protocols

As humans, we've evolved an elaborate set of protocols for sharing the broadcast channel:

*In a single shared broadcast channel :*

- ❖ *two or more simultaneous transmissions by nodes:* \_\_\_\_\_

• **collision** if node receives two or more signals at the same time

“Give everyone a chance to speak.”  
 “Don’t speak until you are spoken to.”  
 “Don’t monopolize the conversation.”  
 “Raise your hand if you have a question.”  
 “Don’t interrupt when someone is speaking.”  
 “Don’t fall asleep when someone is talking.”

**Cocktail party**

Blah, blah, blah

zzzzz

5-21

CHAPTER **5** (5.3) Multiple Access Links & Protocols

**Solution** **Multiple Access Protocols (MAC)**

- ❖ distributed algorithm that determines how nodes share channel,
  - i.e.: determine when node can transmit
- ❖ communication about channel sharing must use channel itself!
  - no *out-of-band* channel for coordination

5-22

CHAPTER **5** (5.3) Multiple Access Links & Protocols

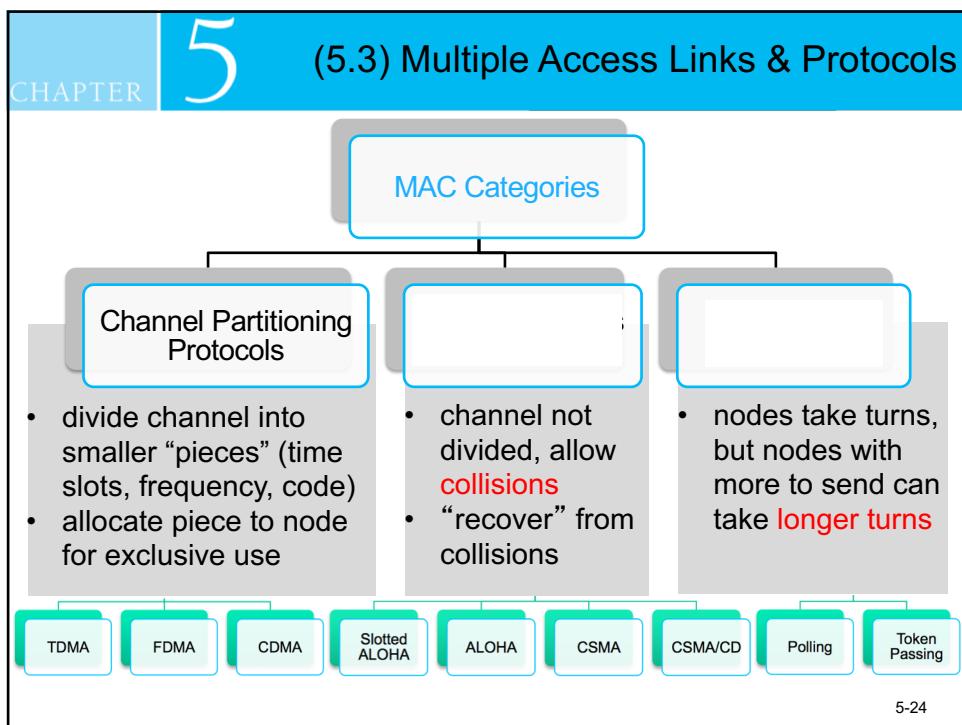

Overview conclusion

A MAC for a broadcast channel of rate  $R$  bps should have the following *desirable characteristics*:

- 1) when one node wants to transmit, it can send at rate  $R$  bps.
- 2) when  $M$  nodes want to transmit, each can send at average rate  $(R / M)$  bps.
- 3) Fully decentralized:
  - no special node to coordinate transmissions
  - no synchronization of clocks, slots
- 4) The protocol is simple.

MAC (Multiple Access Protocol)

5-23

CHAPTER **5** (a) Channel Partitioning Protocols

TDMA

**TDMA: Time Division Multiple Access**

- ❖ access to channel in "rounds" ;
- ❖ each station gets fixed length slot (length = packet transmission time) in each round;
- ❖ unused slots go idle;

**Example:**

- ❖ 6-station LAN, 1,3,4 have packet, slots **2,5,6** idle

5-25

CHAPTER **5** (a) Channel Partitioning Protocols

FDMA

**FDMA: Frequency Division Multiple Access**

- ❖ channel spectrum divided into frequency bands;
- ❖ each station assigned fixed frequency band;
- ❖ unused transmission time in frequency bands go idle;

**Example:**

- ❖ 6-station LAN, 1,3,4 have packet, frequency bands **2,5,6** idle

CHAPTER **5** (a) Channel Partitioning Protocols

**CDMA**

**CDMA: Code Division Multiple Access**

- ❖ Assigns a different \_\_\_\_\_ to each node;
- ❖ Each node uses its unique code to encode the data bits it sends;
- ❖ If the code chosen carefully, different nodes can transmit simultaneously;

- ❖ CDMA has been used in military for some time;
- ❖ now has widespread civilian use, particularly in cellular telephony (wireless channel)

5-27

CHAPTER **5** (b) Random Access Protocols

- ❖ when node has packet to send:
  - transmit at full channel data rate  $R$ ;
  - no *a priori* coordination among nodes;
- ❖ Two or more transmitting nodes → “\_\_\_\_\_”

- ❖ **Random access MAC protocol** specifies:
  - How to **detect** collisions?
  - How to **recover** from collisions? (e.g., via delayed retransmissions)

- ❖ *Examples of random access MAC protocols:*
  - *slotted ALOHA*
  - *ALOHA*
  - *CSMA, CSMA/CD, CSMA/CA*

5-28

CHAPTER 5 (b) Random Access Protocols

Slotted ALOHA

*Assumptions:*

- all frames same size
- time divided into equal size slots (time to transmit 1 frame)
- nodes start to transmit only slot beginning
- nodes are synchronized
- if 2 or more nodes transmit in slot, all nodes detect collision

*Operation:*

- when node obtains fresh frame, transmits in next slot
  - if *no collision*: node can send new frame in next slot
  - if *collision*: node retransmits frame in each subsequent slot with probability  $p$  until success

5-29

CHAPTER 5 (b) Random Access Protocols

Slotted ALOHA

Node 1	1	1	1	1
Node 2	2	2	2	
Node 3	3			3

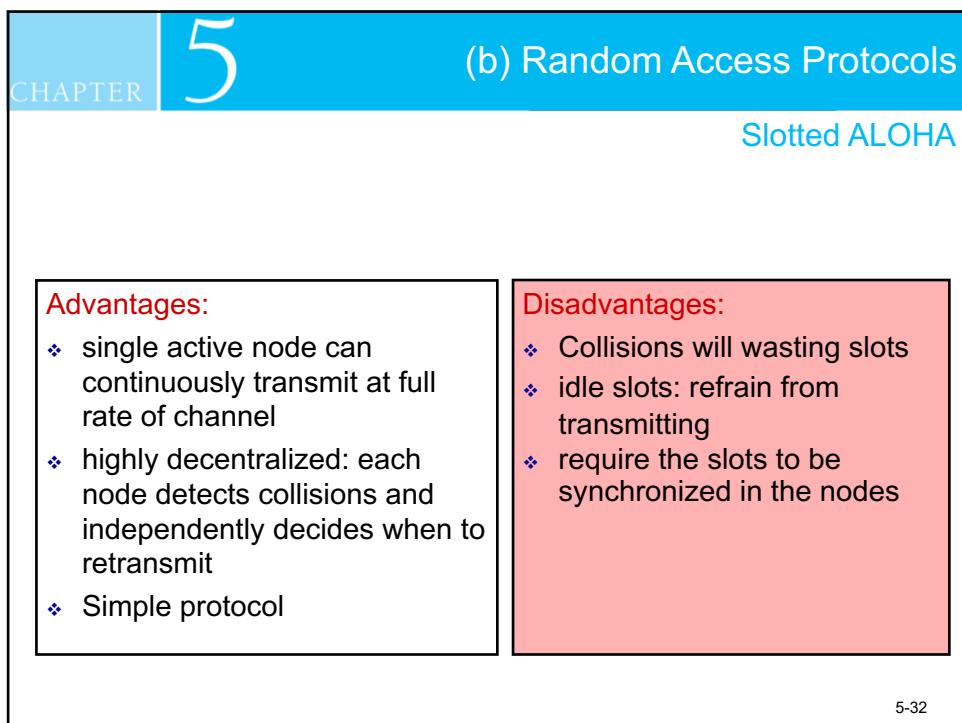

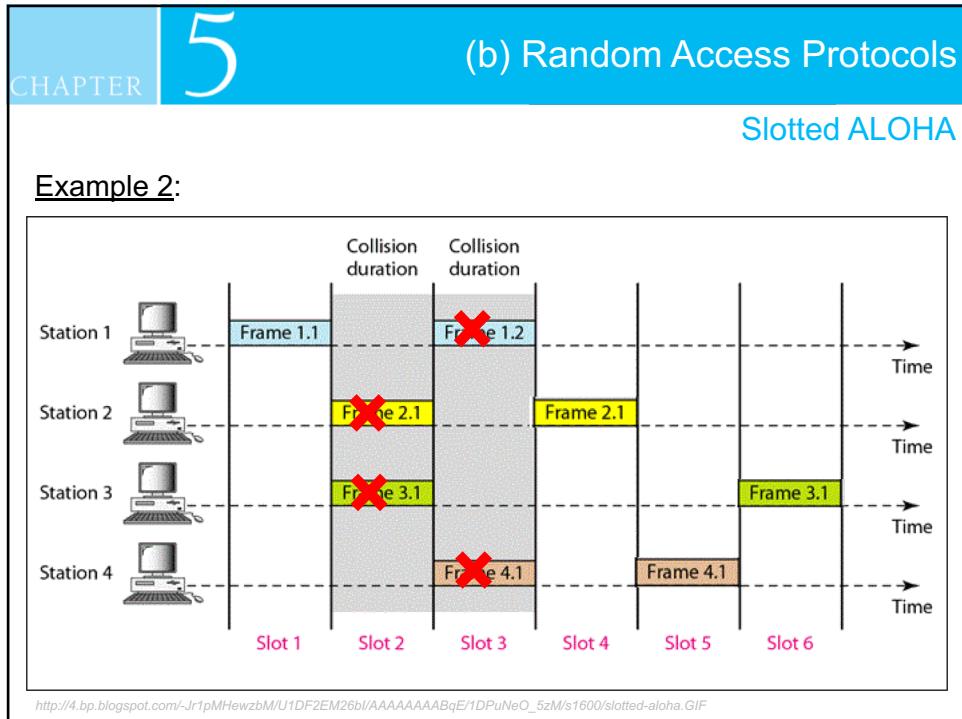

Time

Slot

Key:

- C = Collision slot
- E = Empty slot
- S = Successful slot

**Figure:** Nodes 1, 2, and 3 collide in the first slot. Node 2 finally succeeds in the fourth slot, node 1 in the eighth slot, and node 3 in the ninth slot

## Pure ALOHA (Unslotted)

- ❖ unslotted ALOHA: simpler, no synchronization;
- ❖ when frame first arrives → transmit immediately;
- ❖ collision probability increases:
  - frame sent at  $t_0$  collides with other frames sent in  $[t_0-1, t_0+1]$

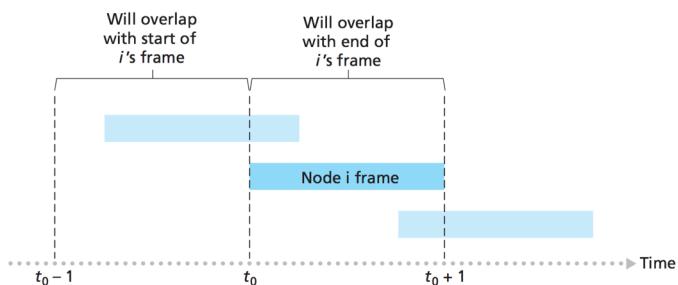

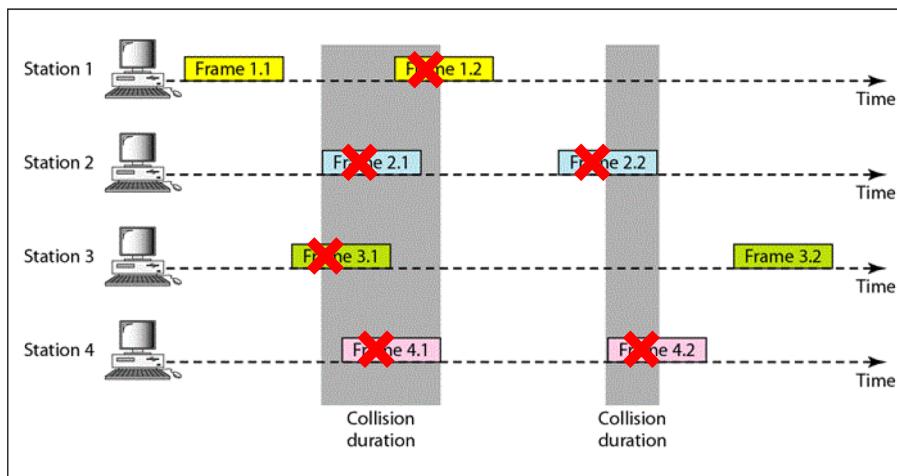

Figure: Interfering transmissions in pure ALOHA.

5-33

## Pure ALOHA (Unslotted)

Example 2:

CHAPTER 5 (b) Random Access Protocols CSMA

**CSMA: Carrier Sense Multiple Access**

- ❖ Listen before transmit:
  - if channel sensed *idle*: transmit entire frame
  - if channel sensed *busy*: defer transmission (abort)
- ❖ Human analogy: Don't interrupt others!

5-35

CHAPTER 5 (b) Random Access Protocols CSMA

- ❖ **Collisions can still occur:** propagation delay means two nodes may not hear each other's transmission.
- ❖ **Collision:** entire packet transmission time wasted
  - distance & propagation delay play role in determining collision probability.

**Figure:** Space-time diagram of two CSMA nodes with colliding transmission.

CHAPTER 5 (b) Random Access Protocols CSMA/CD

**CSMA/CD:** (Carrier Sense Multiple Access / Collision Detection)

- carrier sensing, deferral as in CSMA
  - collisions *detected* within short time;
  - colliding transmissions aborted, reducing channel wastage;

**Collision Detection (CD):**

- easy in wired LANs: measure signal strengths, compare transmitted, received signals;
- difficult in wireless LANs: received signal strength overwhelmed by local transmission strength;
- human analogy: the polite conversationalist

CHAPTER 5 (b) Random Access Protocols CSMA/CD

The diagram illustrates the CSMA/CD protocol. It features a 3D coordinate system with 'Space' on the horizontal axis and 'Time' on the vertical axis. Two transmission frames are shown as light blue pyramids. The first transmission starts at time  $t_0$  and ends at  $t_1$ . The second transmission begins later. A collision occurs during the overlap of the two frames. A red vertical line marks the 'Collision detect/abort time' at a point where the two signals intersect. The region of overlap is shaded with diagonal lines.

**Figure:** CSMA with collision detection (CD). 5-38

CHAPTER **5** (b) Random Access Protocols

CSMA/CD

Summary of the operation from the perspective of an adapter attached to a broadcast channel:

1. NIC receives datagram from network layer, creates frame
2. - If NIC senses channel idle, starts frame transmission;  
- If NIC senses channel busy, waits until channel idle, then transmits.
3. If NIC transmits entire frame without detecting another transmission, NIC is done with frame !
4. If NIC detects another transmission while transmitting, aborts and sends jam signal
5. After aborting, NIC enters ***binary (exponential) backoff***:
  - after  $m$ th collision, NIC chooses  $K$  at random from  $\{0, 1, 2, \dots, 2^m-1\}$ . NIC waits  $K \cdot 512$  bit times, returns to Step 2
  - longer backoff interval with more collisions

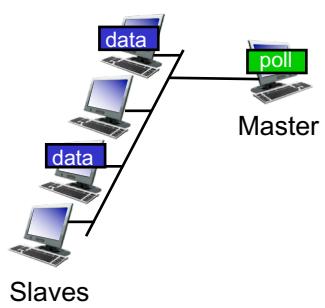

NIC (Network Interface Card))

5-39

CHAPTER **5** (c) Taking-Turns Protocols

Polling

- ❖ Master node “invites” slave nodes to transmit in turn
- ❖ Typically used with “dumb” slave devices
- ❖ Concerns:
  - polling overhead
  - latency
  - single point of failure (master)

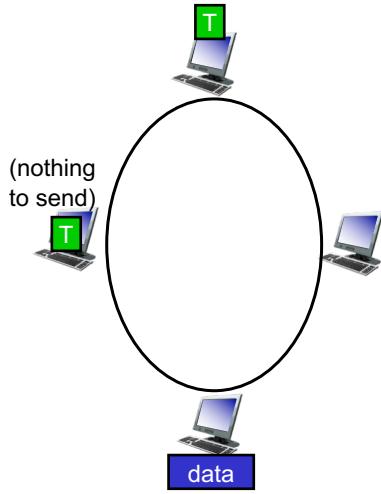

5-40

CHAPTER **5** (c) Taking-Turns Protocols

**Token Passing**

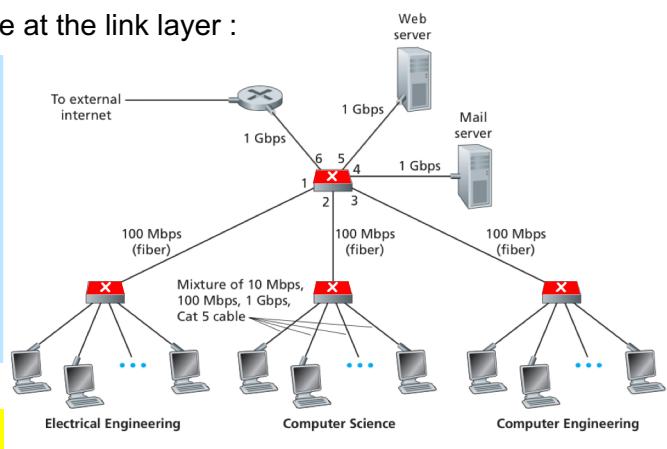

- ❖ Control **token** passed from one node to next sequentially.
- ❖ Token message
- ❖ Concerns:
  - token overhead
  - latency
  - single point of failure (token)

5-41

CHAPTER **5** (5.4) Switched Local Area Networks

- Having covered **broadcast networks** and **multiple access protocols (MAC)** in previous section;
- Switches operate at the link layer :
- switch link-layer frames;
- not recognize network-layer addresses
- not use routing algorithms
- Use link-layer addresses

**Figure:** An institutional network connected together by **four switches**.

CHAPTER **5** Link Layer Addressing and Address Resolution Protocol (ARP)

- 32-bit IP address:
  - network-layer address for interface
  - used for layer 3 (network layer) forwarding
- MAC (or \_\_\_\_\_ or \_\_\_\_\_ or Ethernet) address:
  - function: *used "locally" to get frame from one interface to another physically-connected interface (same network, in IP-addressing sense)*
  - 48 bit MAC address or 6 bytes address (for most LANs) burned in NIC ROM, also sometimes software settable
  - e.g.: 1A-2F-BB-76-09-AD

Hexadecimal (base 16) notation  
(each "number" represents 4 bits)

5-43

CHAPTER **5** Link Layer Addressing and Address Resolution Protocol (ARP)

**LAN / MAC addresses**

- Every piece of Ethernet hardware has the address *“burned in”* to a chip on the hardware.
- The first 3 bytes of an Ethernet address are the manufacturer’s code and the last 3 bytes are a unique sequence number.

Organizational Unique Identifier (OUI)	Vendor Assigned (NIC Cards, Interfaces)
24 Bits	24 Bits
6 hex digits	6 hex digits
00 60 2F	3A 07 BC
Cisco	particular device

Different representations of MAC Addresses

5-44

CHAPTER **5** Link Layer Addressing and Address Resolution Protocol (ARP)

LAN / MAC addresses

Each adapter on LAN has unique and unchanged **MAC / LAN / physical / \_\_\_\_\_ address**;

█ Adapter (interface)

**Figure:** Each interface connected to a LAN has a unique MAC address.

5-45

CHAPTER **5** Link Layer Addressing and Address Resolution Protocol (ARP)

LAN / MAC addresses

- ❖ MAC address allocation administered by IEEE
- ❖ manufacturer buys portion of MAC address space (to assure uniqueness)

- ❖ **Analogy:**
  - MAC address: like *Social Security Number*
  - IP address: like *postal address*

- ❖ MAC flat address → portability
  - can move LAN card from one LAN to another

- ❖ IP hierarchical address → not portable
  - address depends on IP subnet to which node is attached

IEEE (Institute of Electrical and Electronics Engineers)

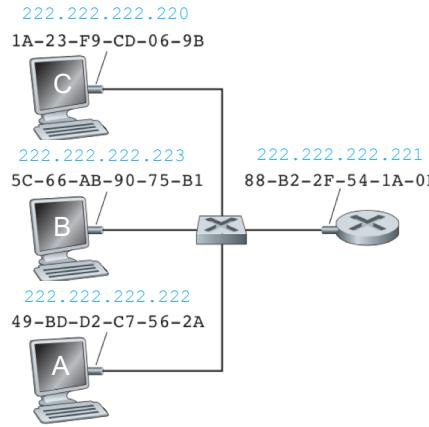

5-46

CHAPTER **5** Link Layer Addressing and Address Resolution Protocol (ARP)

**Q:** How to determine interface's MAC address, knowing its IP address? **ARP**

**ARP table:** each IP node (host, router) on LAN has an ARP table

- IP/MAC address mappings for some LAN nodes:
  - < IP address; MAC address; TTL >
- TTL (Time To Live):* time after which address mapping will be forgotten (typically 20 min)

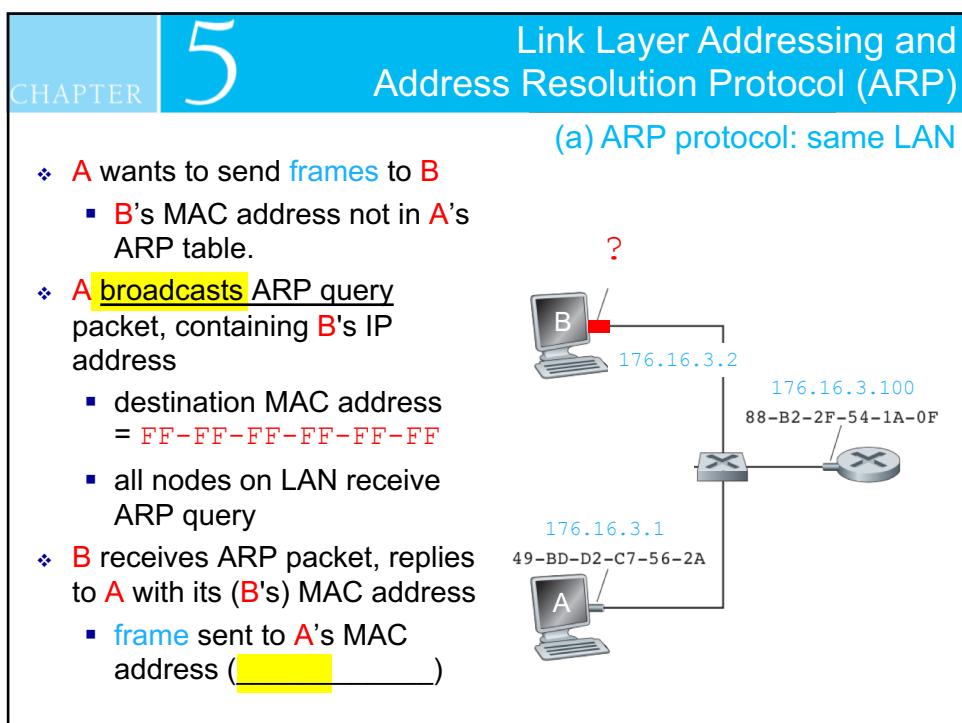

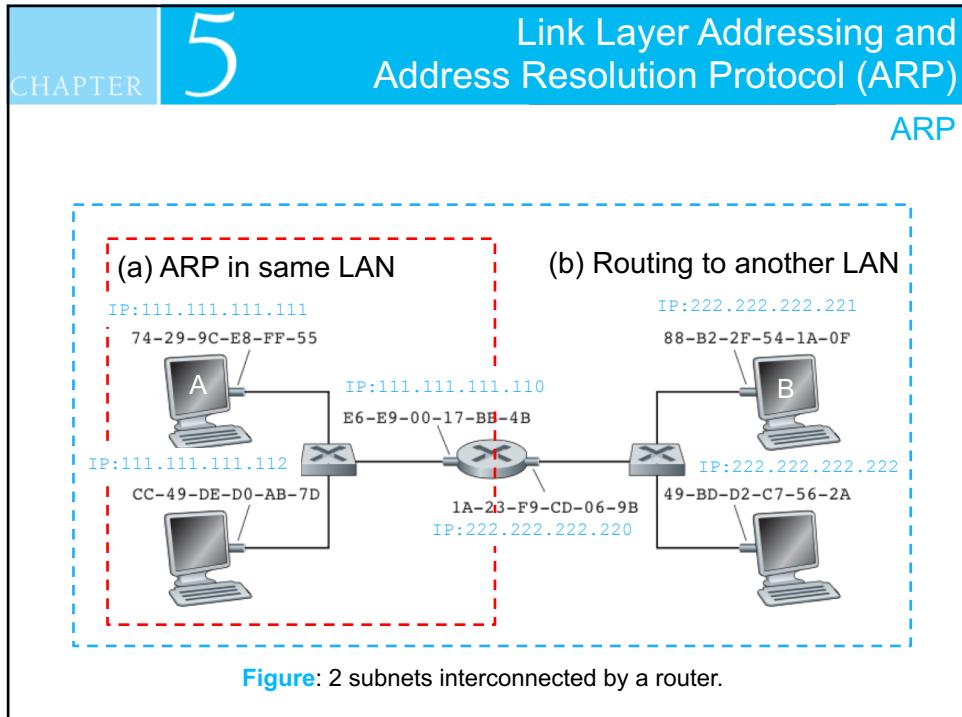

**Figure:** Each interface on a LAN has an IP address and a MAC address.

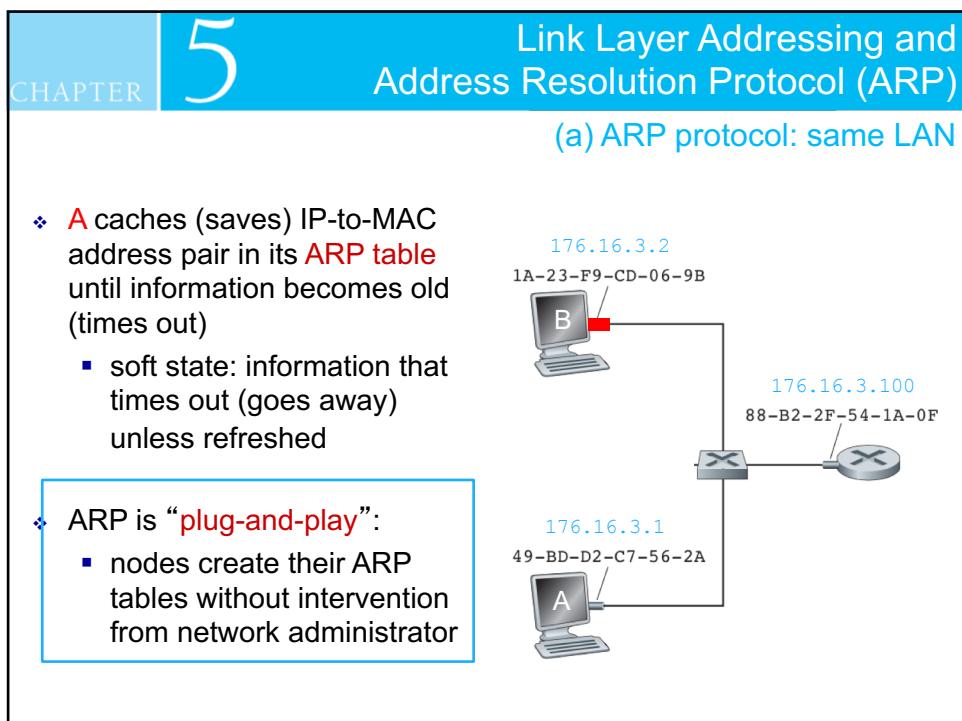

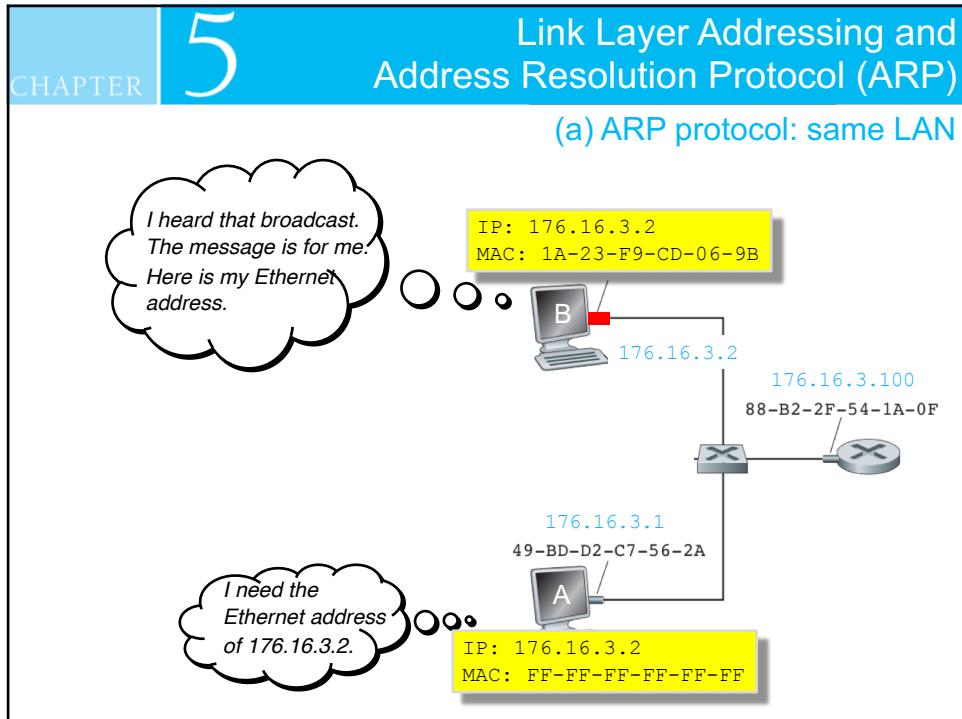

CHAPTER **5** Link Layer Addressing and Address Resolution Protocol (ARP)

**ARP**

IP Address	MAC Address	TTL
222.222.222.221	88-B2-2F-54-1A-0F	13:45:00
222.222.222.223	5C-66-AB-90-75-B1	13:52:00

**Figure:** A possible ARP table in 222.222.222.220

CHAPTER **5** Link Layer Addressing and Address Resolution Protocol (ARP)

(b) Addressing: routing to another LAN

Walkthrough: **send datagram from A to B via a router**

- focus on addressing – at IP ( \_\_\_\_\_ ) and MAC layer ( \_\_\_\_\_ )
  - assume A knows B's IP address
  - assume A knows IP address of first hop router
  - assume A knows router's MAC address

How ???

**Figure:** Two subnets interconnected by a router. 5-53

CHAPTER **5** Link Layer Addressing and Address Resolution Protocol (ARP)

(b) Addressing: routing to another LAN

**Link-layer frame**  
src: 74-29-9C-E8-FF-55

**IP datagram**  
src: 111.111.111.111  
dest: 222.222.222.221

**Figure:** Two subnets interconnected by a router. 5-54

Suppose A sends frame to B.

- What is the source and destination IP address at *X* and *Y*?
- What is the source and destination Ethernet address at *X* and *Y*?

5-55

a) IP address *X* *Y*  
 source :  
 destination :

b) Ethernet address *X* *Y*  
 source :  
 destination :

5-56

CHAPTER 5 Ethernet

“dominant” wired LAN technology:

- cheap \$20 for NIC
- first widely used LAN technology
- simpler, cheaper than token LANs and ATM
- kept up with speed race: 10 Mbps – 10 Gbps

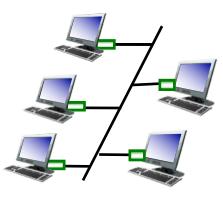

**Figure:** Melcalfe's Ethernet sketch.

5-57

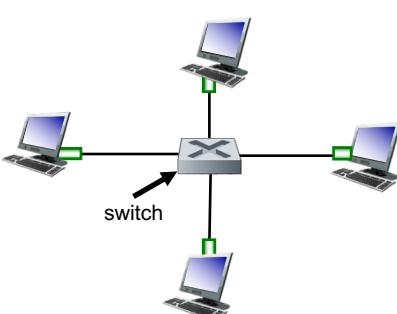

CHAPTER 5 Ethernet

**Physical topology**

- \_\_\_\_\_ : popular through mid 90s
  - all nodes in same collision domain (can collide with each other)
- \_\_\_\_\_ : prevails today
  - active **switch** in center
  - each “spoke” runs a (separate) Ethernet protocol (nodes do not collide with each other)

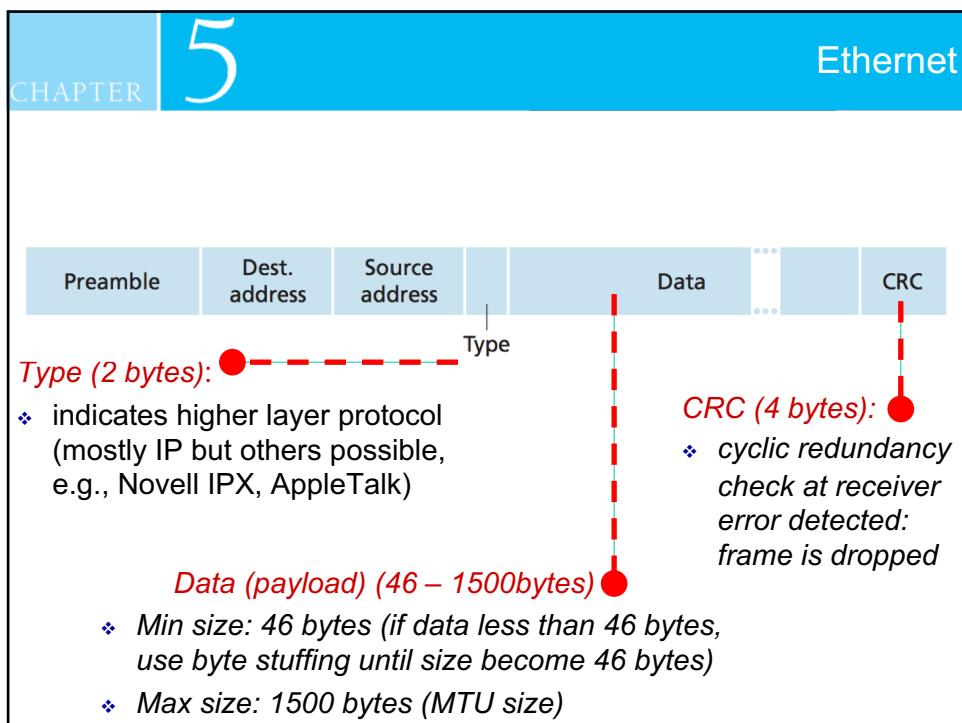

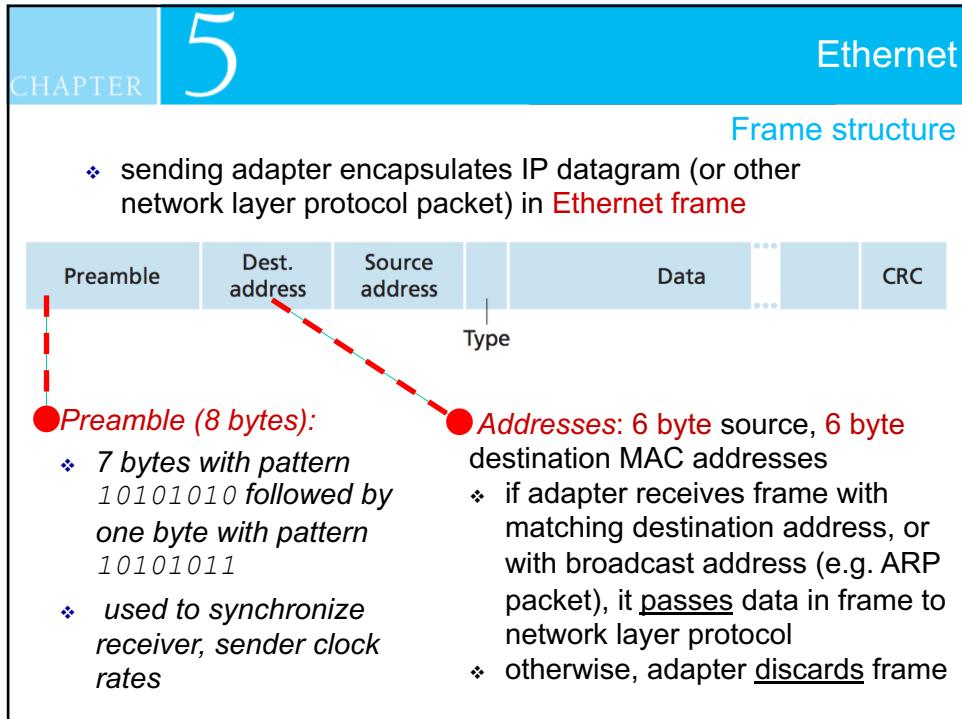

Coaxial cable

switch

5-58

CHAPTER **5** Ethernet

Connectionless, Unreliable

**Connectionless:**  
No handshaking between sending and receiving NICs

**Unreliable:**  
Receiving NIC doesn't send ACKs or NAKs to sending NIC

- ❖ data in dropped frames recovered only if initial sender uses higher layer rdt (e.g., TCP), otherwise dropped data lost

❖ Ethernet's MAC protocol:
 

- unslotted **CSMA/CD with binary backoff**

5-61

CHAPTER **5** Ethernet

Ethernet standard: IEEE 802.3 CSMA/CD

- ❖ **Many** different Ethernet standards
  - common MAC protocol and frame format
  - different speeds:  $2Mbps$ ,  $10Mbps$ ,  $100Mbps$ ,  $1Gbps$ ,  $10Gbps$
  - different physical layer media: fiber, cable

Application	MAC protocol and frame format		
Transport	100BASE-TX	100BASE-T2	100BASE-FX
Network	100BASE-T4	100BASE-SX	100BASE-BX
Link			
Physical			

copper (twister pair) physical layer      fiber physical layer

5-62

CHAPTER **5** Link-Layer Switches

- ❖ **link-layer device: takes an *active* role**
  - store, forward Ethernet frames
  - examine incoming frame's MAC address, **selectively** forward frame to one-or-more outgoing links when frame is to be forwarded on segment, uses CSMA/CD to access segment
- ❖ **transparent**
  - hosts are unaware of presence of switches
- ❖ **plug-and-play, self-learning**
  - switches do not need to be configured

<https://encrypted-tbn0.gstatic.com/images?q=tbn:ANd9GcQoUD37sS32DJUtlDM4D7roLy-B8ceHm58lsI40JvFeToiqBQeN>

5-63

CHAPTER **5** Link-Layer Switches

**Multiple simultaneous transmissions**

- ❖ hosts have dedicated, direct connection to switch
- ❖ switches will buffer the packets
- ❖ Ethernet protocol used on each incoming link, but no collisions; full duplex
  - each link has its own collision domain
- ❖ **switching:** A-to-A' and B-to-B' can transmit simultaneously, without collisions

switch with six interfaces  
(1,2,3,4,5,6)

5-64

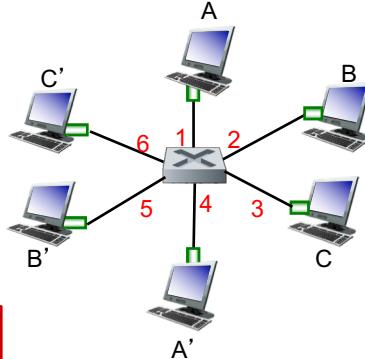

CHAPTER **5** Link-Layer Switches

**Forwarding table**

**Q:** How does switch know A' reachable via interface 4, B' reachable via interface 5?

**A:** Each switch has a \_\_\_\_\_, each entry:  
 ❖ (MAC address of host, interface to reach host, time stamp)  
 ❖ looks like a routing table!

**Q:** How are entries created, maintained in switch table?  
 ❖ something like a routing protocol?

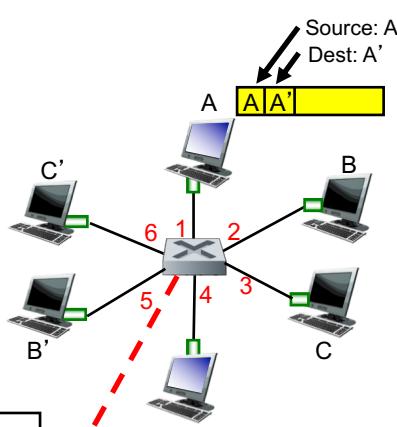

switch with six interfaces  
(1,2,3,4,5,6)

5-65

CHAPTER **5** Link-Layer Switches

**Operation: Self-learning**

❖ switch *learns* which hosts can be reached through which interfaces  
 ▪ when frame received, switch “learns” location of sender: incoming LAN segment  
 ▪ records sender/location pair in switch table

MAC addr.	Interface	TTL
A	1	60

Switch table (initially empty)

5-66

CHAPTER **5** Link-Layer Switches

Operation: Filtering / Forwarding

When frame received at switch:

- 1- record *incoming link*, *MAC address* of sending host
- 2- index switch table using MAC destination address

```

3- if entry found for destination
  then {
    if destination on segment from which frame arrived
    then drop frame
    else forward frame on interface indicated by entry
  }
else flood /* forward on all interfaces except arriving
  interface */

```

5-67

CHAPTER **5** Link-Layer Switches

Example: Self-learning / Forwarding

- ❖ frame destination, A', location unknown: *flood*
- ❖ destination A location known: *selectively send on just one link*

MAC addr.	Interface	TTL
A	1	60
A'	4	60

switch table (initially empty)

5-68

CHAPTER **5** Link-Layer Switches

Interconnecting switches

- switches can be connected together

**Q:** (Sending from A to G) - How does  $S_1$  know to forward frame destined to G via  $S_4$  and  $S_3$ ?

**A:** \_\_\_\_\_  
(works exactly the same as in single-switch case!)

5-69

CHAPTER **5** Exercise 5.4

Suppose A sends frame to G, G responds to A.  
Show the switch tables in  $S_1$ ,  $S_3$ ,  $S_4$

Switch table  $S_1$ :

Mac addr.	Interface

Switch table  $S_4$ :

Mac addr.	Interface

Switch table  $S_3$ :

Mac addr.	Interface

5-70

## CHAPTER 5 Link-Layer Switches

### Switches vs. Routers

**Both are :**

- **routers:** network-layer devices (examine network-layer headers)
- **switches:** link-layer devices (examine link-layer headers)

**Both have**

- **routers:** compute tables using routing algorithms, IP addresses
- **switches:** learn forwarding table using flooding, learning, MAC addresses

## CHAPTER 5 Virtual Local Area Networks (VLAN)

### Motivation

**Consider :**

- ❖ CS user moves office to EE, but wants connect to CS switch?
- ❖ single broadcast domain:
  - all layer-2 broadcast traffic (ARP, DHCP, unknown location of destination MAC address) must cross entire LAN
  - security/privacy, efficiency issues

**Figure:** An institutional network connected together by four switches.

## CHAPTER 5 Virtual Local Area Networks (VLAN)

**Solution**

**Virtual Local Area Network**

Switch(es) supporting VLAN capabilities can be configured to define multiple **virtual LANs** over single physical LAN infrastructure.

**Port-based VLAN:**  
switch ports grouped (by switch management software) so that **single** physical switch .....

... operates as **multiple** virtual switches

## CHAPTER 5 Virtual Local Area Networks (VLAN)

**Port-based VLAN**

- ❖ **traffic isolation:** frames to/from ports 1-8 can *only* reach ports 1-8
  - can also define VLAN based on MAC addresses of endpoints, rather than switch port
- ❖ **dynamic membership:** ports can be dynamically assigned among VLANs
- ❖ **forwarding between VLANs:** done via routing (just as with separate switches)
  - in practice vendors sell combined switches plus routers

5-74

CHAPTER **5** Virtual Local Area Networks (VLAN)

**VLAN spanning multiple switches**

❖ Trunk link: carries frames between VLANs defined over multiple physical switches

- frames forwarded within VLAN between switches can't be vanilla 802.1 frames (must carry VLAN ID info)
- 802.1q protocol adds/removed additional header fields for frames forwarded between trunk ports

5-75

CHAPTER **5** Virtual Local Area Networks (VLAN)

**802.1Q VLAN frame format**

**Figure:** Original Ethernet frame (top), 802.1Q-tagged Ethernet VLAN frame (below).

5-76

CHAPTER **5** (5.5) Data Center Networking

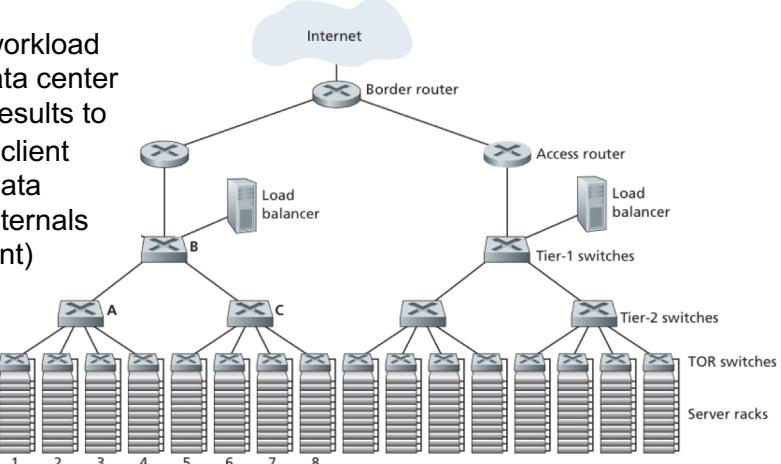

- ❖ 10's to 100's of thousands of hosts, often closely coupled, in close proximity:
  - e-business (e.g.  )
  - content-servers (e.g.     )
  - search engines, data mining (e.g.  )
- ❖ Challenges:
  - multiple applications, each serving massive numbers of clients
  - managing/balancing load, avoiding processing, networking, data bottlenecks

Inside a 40-ft Microsoft container, Chicago data center

CHAPTER **5** Load balancing

- receives external client requests
- directs workload within data center
- returns results to external client (hiding data center internals from client)

**Figure:** A data center network with a hierarchical topology.

CHAPTER 5

### Load balancing

- receives external client requests
- directs workload within data center
- returns results to external client (hiding data center internals from client)

**Figure:** A data center network with a hierarchical topology.

CHAPTER 5

### Trends in data center networking

- Rich interconnection among switches, racks:
  - increased throughput between racks (multiple routing paths possible)
  - increased reliability via redundancy

**Figure:** Highly-interconnected data network topology.

- ❖ Journey down protocol stack complete!
  - application, transport, network, link
- ❖ putting-it-all-together: **synthesis!**
  - **goal:** identify, review, understand protocols (at all layers) involved in seemingly simple scenario: requesting `www` page
  - **scenario:** student attaches laptop to campus network, requests/receives `www.google.com`

5-81

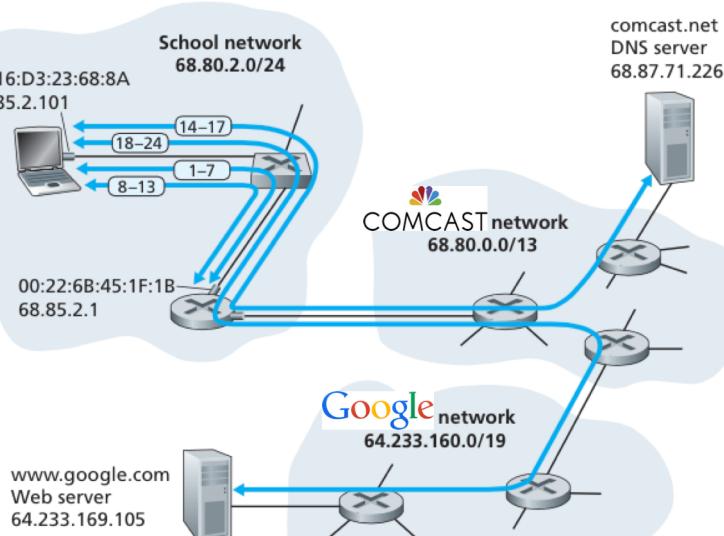

Figure: A day in the life of a Web page request: network setting and actions

CHAPTER 5

Connecting to the Internet

The diagram illustrates the initial step of a laptop connecting to the Internet. The laptop's stack includes Phy, Eth, IP, UDP, and DHCP layers. The router, which runs a DHCP server, also has a stack with these layers. A red arrow points from the laptop's stack to the router, representing the broadcast nature of the DHCP request on the LAN.

- ❖ connecting laptop needs to get its own IP address, addr of first-hop router, addr of DNS server: use **DHCP**
- ❖ DHCP request *encapsulated* in **UDP**, encapsulated in **IP**, encapsulated in **802.3** Ethernet
- ❖ Ethernet frame *broadcast* (dest: FF-FF-FF-FF-FF-FF) on LAN, received at router running **DHCP** server
- ❖ Ethernet *demuxed* to IP demuxed, UDP demuxed to DHCP

5-83

CHAPTER 5

Connecting to the Internet

The diagram illustrates the response from the DHCP server. The router's stack includes Phy, Eth, IP, UDP, and DHCP layers. The laptop's stack includes Phy, Eth, IP, UDP, and DHCP layers. A red arrow points from the router's stack to the laptop, representing the reply being forwarded through the LAN and demultiplexed at the client.

- ❖ DHCP server formulates **DHCP ACK** containing client's IP address, IP address of first-hop router for client, name & IP address of DNS server
- ❖ encapsulation at DHCP server, frame forwarded (**switch learning**) through LAN, demultiplexing at client
- ❖ DHCP client receives DHCP ACK reply

*Client now has IP address, knows name & address of DNS server, IP address of its first-hop router*

5-84

CHAPTER 5

5

ARP (before DNS, HTTP)

❖ before sending **HTTP** request, need IP address of [www.google.com](http://www.google.com): **DNS**

❖ DNS query created, encapsulated in UDP, encapsulated in IP, encapsulated in Eth. To send frame to router, need MAC address of router interface: **ARP**

- ❖ **ARP query** broadcast, received by router, which replies with **ARP reply** giving MAC address of router interface
- ❖ client now knows MAC address of first hop router, so can now send frame containing DNS query

5-85

CHAPTER 5

5

...using DNS

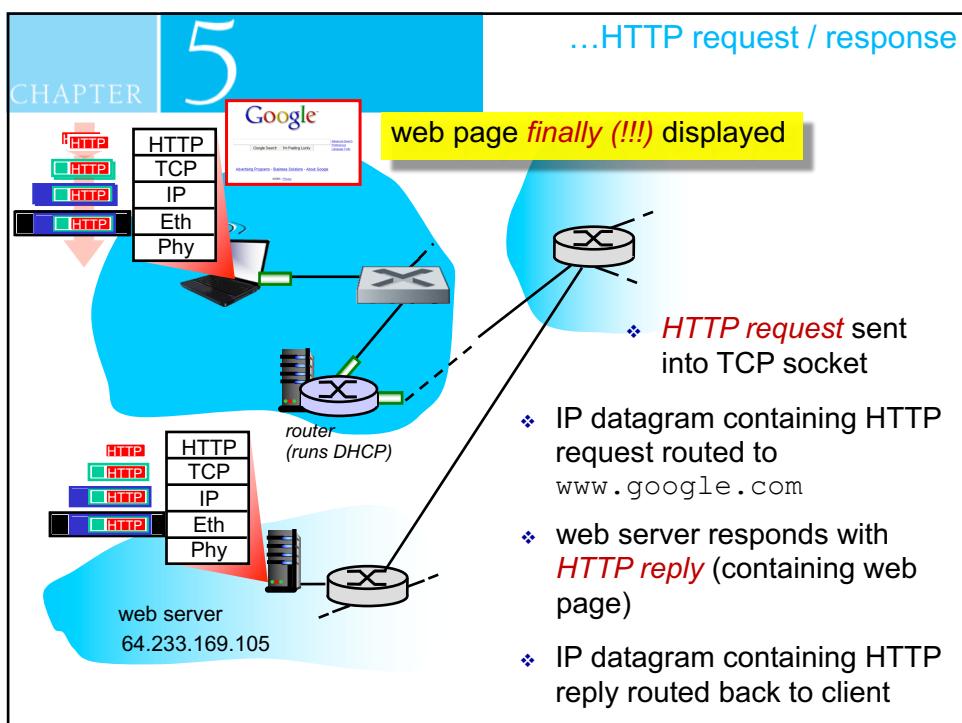

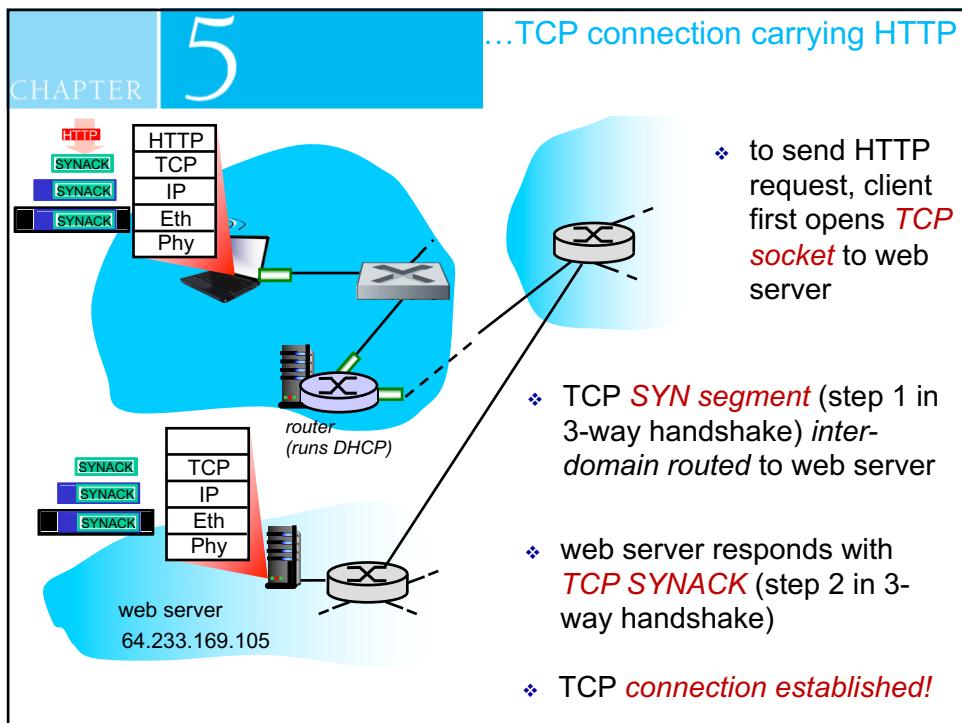

❖ IP datagram containing DNS query forwarded via LAN switch from client to 1<sup>st</sup> hop router

❖ IP datagram forwarded from campus network into comcast network, routed (tables created by **RIP**, **OSPF**, **IS-IS** and/or **BGP** routing protocols) to DNS server

❖ demux'ed to DNS server

❖ DNS server replies to client with IP address of [www.google.com](http://www.google.com)

5-86

CHAPTER **5** Summary

- ❖ principles behind data link layer services:
  - error detection, correction
  - sharing a broadcast channel: multiple access
  - link layer addressing
- ❖ instantiation and implementation of various link layer technologies
  - Ethernet
  - switched LANS, VLANs
  - virtualized networks as a link layer: MPLS
- ❖ synthesis: a day in the life of a web request

5-89

CHAPTER **5** Summary

- ❖ journey down protocol stack *complete* (except PHY)
- ❖ solid understanding of networking principles, practice
- ❖ ..... could stop here .... but *lots* of interesting topics!
  - wireless
  - multimedia
  - security
  - network management

5-90
