ASSIGNMENT 2 BY GROUP 3

NUR AFIKAH BINTI MOHD HAYAZI (A20EC0220) AMIR FIRDAUS BIN ROSMAN (A20EC0180) SYAZA SYAURAH BINTI MOHD YUSRAN (A20EC0227)

- 1. Consider 3-digit number whose digit are either 2,3, 4, 5, 6 or 7,
- a. How many numbers are there?

 Number= 6
- b. How many numbers are there if the digits are distinct?

Numbers = 6x5x4=120

c. How many numbers between 300 to 700 are only odd digits allowed? Numbers = 4x6x3=72

- 2. Anita invited 10 of her friends, a couple, four men and four women to her anniversary dinner, how many ways Anita can arrange them around a round dinner table
- a. Men insist to sit next to each other

- b. The couple insisted to sit next to each other (9-1)! X 2! = 80 640 ways
- c. Men and women sit in alternate seat (5-1)! = 4! = 24 ways
- d. Before her friend left, Anita wanted to arrange a photoshoot. How many ways can her photographer arrange in a row, if Anita and her husband stand next to each other

11! X 2! = 79,833,600 ways

3. In a school sport day, five sprinters are competing in a 100 meter race. How many ways are there for the sprinter to finish

- b. Two sprinters tie (4) x 3! = 24 ways
- c. Two group of two sprinters tie (4)(3)(1!)=12 ways

- 4. A croissant shop has plain croissants, cherry croissants, chocolate croissants, almond croissants, apple croissants, and broccoli croissants. How many ways are there to choose
- a. a dozen croissants?

$$C(17,12) = 17!/(12!x(6-1)!) = 6188$$
 ways

b. two dozen croissants with at least two of each kind?

$$C(17,12) = 17! / (12! X (6-1)!) = 6188 ways$$

c. two dozen croissants with at least five chocolate croissants and at least three almond croissants?

- 5. This procedure is used to break ties in games in the championship round of the World Cup soccer tournament. Each team selects five players in a prescribed order. Each of these players takes a penalty kick, with a player from the first team followed by a player from the second team and so on, following the order of players specified. If the score is still tied at the end of the 10 penalty kicks, this procedure is repeated. If the score is still tied after 20 penalty kicks, a sudden-death shootout occurs, with the first team scoring an unanswered goal victorious.
- a. How many different scoring scenarios are possible if the game is settled in the first round of 10 penalty kicks, where the round ends once it is impossible for a team to equal the number of goals scored by the other team?

$$C(4,2) = 6$$

 $C(3,1) = 3$

2 wins 1 Tie =
$$C(4,2) \times C(3,1) \times 2 = 36$$

1 win 3 Ties =
$$C(3,1) \times C(4,3) \times 2 = 96$$

Scenario = 2 x (36+96) = 264 ways

b. How many different scoring scenarios for the first and second groups of penalty kicks are possible if the game is settled in the second round of 10 penalty kicks?

```
total= 2^10 = 1024

Possible = 1024- 264 = 760

1st round = 760

2nd round = 264

Scenarios = 760 x 264 = 200, 640 ways
```

c. How many scoring scenarios are possible for the full set of penalty kicks if the game is settled with no more than 10 total additional kicks after the two rounds of five kicks for each team?

```
1st round = 760
2nd round= 760
Sudden death = 10 ways
```

Scenario = $760 \times 760 \times 10 = 5,776,000$ ways

6. A professor gives a multiple-choice quiz that has ten questions, each with four possible responses, a,b,c,d. What is the minimum number of students that must be in the professor's class in order to guarantee that at least three answer sheets must be identical? (Assume that no answers are left blank.)

$$k= 10^4 = 10\ 000$$
 $[n/k] = 3$
 $n = k (m-1) + 1$
 $= 10\ 000 (3-1) + 1$
 $= 20\ 001$
Min Students = 20\ 001

7. In a secondary examination, 75% of the students have passed in history and 65% in Mathematics, while 50% passed both in history and mathematics. If 35 candidates failed in both the subjects, what is the number of candidates sitting for the exam?

$$P(H) = 0.75$$
 $P(H') = 0.25$

P (M) = 0.65 P (M') = 0.35
P (H
$$\cap$$
 M) = 0.50
P (H' \cup M') = 0.10
People failed = 35
0.1 X x = 35
x = 350 students

8. An integer from 300 through 780, inclusive is to be chosen at random, find the probability that the number is chosen will have 1 as at least one digit.

No condition : $9^3 = 729$ One digit : $9 \times 10^2 = 900$

P(n1) = (900-729) / 900 = 171/900

- 9. Two blue and four yellow cars are to be parked in a row of 10 parking lots. Assume that cars of the same color are not distinguishable, and the parking lots are chosen at random.
- a. In how many ways can the cars be parked in the parking lots?10P6= 151 200 ways
- b. In how many ways can the cars be parked so that the empty lots are next to each one another? Find the probability that the empty lots are next to one another? $(6!)(4!) \times 2 = 34,560$ ways

- 10. A coach wishes to give a message to a trainee. The probabilities that he uses email, letter and handphone are 0.4,0.1 and 0.5 respectively. He uses only one method. The probabilities of the trainee receiving the message if the coach uses email, letter or handphone are 0.6,0.8 and 1 respectively
- a. Find the probability the trainee receives the message

$$P(E) = 0.4$$
, $P(T|E) = 0.6$
 $P(L) = 0.1$, $P(T|L) = 0.8$
 $P(H) = 0.5$, $P(T|H) = 1$

$$P(T) = P(P(T|H)P(H) + P(T|L)P(L) + PP(T|E)P(E)$$

= 0.24 + 0.08 + 0.5
= 0.82

b. Given that the trainee receives the messages, find the conditional probabilities that he receives it via email

$$P(E|T) = P(E \cap T) / P(T)$$

= 0.24/0.82
= 0.29

11. In recent News, it was reported that light trucks, which include SUV's, pick-up trucks and minivans, accounted for 40% of all personal vehicles on the road in 2012. Assume the rest are cars. Of every 100,000 cars accidents, 20 involve a fatality; of every 100,000 light trucks accidents, 25 involve a fatality. If a fatal accident is chosen at random, what is the probability the accident involved a light truck?

```
T = 40%

cars= 60%

P(A \mid C) = 1/5000
P(A \mid T) = 1/4000
P(A) = P(A \mid C) P(C) + P(A \mid T) P(T)
= (0.00025)(0.4) + (0.0002)(0.60)
= 0.00022
P(T \mid A) = \frac{P(A \mid L) P(L)}{P(A)}
= \frac{(0.4)(0.00025)}{0.00022}
= 0.4545
```

12. There are 9 letters having different colors (red, orange, yellow, green, blue, indigo, velvet) and 4 boxes of different shapes (tetrahedron, cube, polyhedron, dodecahedron). How many ways are there to place these 9 letters into the 4 boxes such that each box contains at least 1 letter?

```
4^9= 512^2 = 262,144

4 x 3^9= 19683 x 4= 78,732

4 x 2^9= 2048

4 x 1^9= 4
```
